

CMDDA-1 Stand Kit

A simple aid to carrying out CO room safety tests as laid out in BS7967 & CMDDA1.

All **BlueLine®** Flue Gas Analysers have CO room safety tests built in to the software to enable Registered Engineers to respond to reports of fumes or carbon monoxide alarm activation.

These tests require the engineers to take a sample 2m high in a central location of the room, or at least 1m away from the appliance and most of these tests are a minimum of 15 minutes. Obviously this takes it toll on the engineers arm and the use of ladders or steps doesn't exactly instill an air of professionalism with the customer.

The CMDDA-1 Stand Kit will hold the **BlueLine®** sample probe in the correct position and at the correct height to carry out these CO room safety tests and includes an attached metal analyser bracket where you can magnetically attach your analyse, holding it at a convenient height to both operate the instrument and view the on-screen data.

Using this Tripod kit along with the BlueLine® instruments simple menu measurement system (supplied on all BlueLine® analysers) enables the Engineer to carry out the timed CO room safety tests and save the data to the built in SD Card to issue reports to the customer. This can also be done using an infrared or Bluetooth printer on site.
