Lasting Beauty that Withstands the Elements

Performance • Appearance • Durability

While vinyl siding offers many options to make your home more beautiful, MountainSide Reinforced Siding provides additional value and options that were never possible with traditional vinyl:

- Provides additional support to the siding panel.
- Eliminates waving, sagging, shifting and warping associated with traditional vinyl siding.
- Adds r-value, improving the thermal performance of the wall.
- Available in D-4 or DL-5 Profiles
- Premium .044 Thickness
- Limited Lifetime Warranty

Imperfections in the wall can show through unsupported siding, giving your home a wavy appearance.

MountainSide levels the wall under the siding, reducing wavy wall lines.

Initial Siding Insulation Investment

The value you gain by adding MountainSide to your home will be obvious from the very first day. It has lower installation costs than alternative products and generates less waste during installation. You can also qualify for tax credits and other incentives. After all, insulation is cheaper than heat in the long run!

Ongoing Insulation Cost/Savings

Once it's installed on your home, MountainSide reinforced siding will save you money everyday by lowering your utility bills and eliminating costly maintenance and repairs associated with other siding options.

Potential Long Term Gains of MountainSide

If the time comes to sell your home, the low maintenance exterior that MountainSide provides will eliminate spending time and money to prepare your home for sale. In addition, not only will you save money on your utility bills for as long as you're in the home, but homes with lower utility bills sell faster!

MountainSide provides greater durability and impact resistance than traditional siding!

Give your home an appealing appearance that can stand up to the elements with MountainSide.

Traditional siding creates a hollow void between the wall and the siding, leaving it susceptible to damage.

MountainSide features a foam core that eliminates the hollow void behind the siding, acting like a shock absorber to reduce cracking, denting and breakage.
