

There's so much new information coming to light about the ingredients inside the shots.

The most interesting ingredient being the graphene oxide nanoparticles.

This ingredient explains why there have been such complications for countless individuals who have received the shots.

Because of this new information, learning how it's made and what it's originally derived from, I am going to make a few suggestions for those who have received the shots and are having the following complications:

- Lung and Pulmonary Complications
- Headaches
- Migraines
- Blood Clots
- Elevated Blood Pressure
- Chest Pain
- Cardiovascular Complications
- Arrhythmia
- Severe fatigue
- (Sudden onset and/or unexplainable) Joint Pain / Inflammation
- Skin Lesions and/or unexplainable bruising

Even though the shot is irreversible we're hoping that the recommendations below will help mitigate the negative reactions. (take as recommended on bottle):

- Serrapeptase
- Nattokinase
- Cat's Claw
- Astragulas
- Nature's Unique Vita-Min

If you're currently taking medications, please check with your doctor before taking any of the above.
