

Drones and trespassing

Drone technology is advancing faster than the law can figure out what the legal restrictions should be. I read an article this morning that is looking to create an international database, where one can elect to enter their address and GPS coordinates, so drones are warned in real-time if trespassing might occur.

“All you need to do is enter your address into NoFlyZone.org, provide and verify some additional information, and the site will store the GPS coordinates of your place of residence for drones worldwide to avoid” (Rad, 2015, para. 2).
