

Chapter 11

Bleeding, Soft Tissue Wounds, and Shock Management

Mosby items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

Circulatory System

- Responsible for transporting O_2 and other nutrients to all tissues of the body while also removing CO_2 and other waste products
- Basic components
 - Heart (Pump)
 - Blood vessels (Pipe)
 - Blood (Fluid)

Mosby items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

2

Circulatory System

Mosby items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

3

Circulatory System

- Blood vessels
 - Arteries
 - Vessels that carry blood away from heart
 - Transport blood that contains high levels of O_2
 - Composed of smooth muscles and are constantly changing in size to become either wider or narrower in response to body's blood pressure needs
 - Pressure usually higher than pressure in venous system

Mosby items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

4

Circulatory System

- Blood vessels
 - Veins
 - Vessels that carry blood back toward heart
 - Usually carry blood with low levels of O_2 and wastes from cells
 - Not as muscular as arteries
 - Fluid is typically under lower pressure
 - Largest veins in body direct blood low in oxygen and high in waste back into heart
 - Superior vena cavae
 - Inferior vena cavae

Mosby items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

5

Circulatory System

- Blood vessels
 - Capillaries
 - Smallest type of blood vessels
 - Connect arteries to veins
 - Site of gas exchange in lungs and other body tissues
 - O_2 and nutrients are exchanged for CO_2 and other wastes in blood

Mosby items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

6

Circulatory System

- Blood
 - Fluid transported by blood vessels
 - Consists of several elements:
 - Red blood cells (RBC)
 - White blood cells (WBC)
 - Platelets
 - Plasma

Mosby items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

7

Types of Bleeding

- Bleeding
 - Loss of blood; also called hemorrhage
 - Body protects against blood loss in two main ways
 - Producing blood clots
 - Constricting blood vessels
 - Uncontrolled bleeding leads to shock and death
 - Goal
 - Stop or limit amount of blood loss
 - Blood loss can occur
 - Outside body
 - Inside body

Mosby items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

8

Types of Bleeding

- External bleeding
 - Occurs outside body and can be seen
 - Easier to detect, identify source, and control
 - Arterial bleeding
 - Most severe type of hemorrhage
 - Most likely to quickly lead to
 - Most difficult to control
 - Blood will spurt from open artery with each beat of heart

Mosby items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

9

Types of Bleeding

Mosby items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

10

Types of Bleeding

- Venous bleeding
 - Blood escaping from veins
 - Blood has already delivered O_2 to body tissues
 - Appears darker red
 - Generally blood does not spurt out
 - Under lower pressure
 - Blood flows steadily out of wound
 - Bleeding can be heavy
 - Easier to control than arterial bleeding

Mosby items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

11

Types of Bleeding

- Capillaries
 - Microscopic blood vessels between arteries and veins
 - Vessels so small blood merely oozes out
 - Blood is darker red
- Capillary bleeding
 - Typically insignificant
 - Clots spontaneously
 - Requires little intervention

Mosby items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

12

Types of Bleeding

- Assessment
 - Safety and PPE
 - Scene Size Up
 - General Impression
 - Initial Assessment (ABC's)
 - Control ABC's and perform physical exam
 - Ongoing assessment when indicated

Mosby Items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

13

Types of Bleeding

- Bleeding control
 - Direct pressure while elevating extremity
 - First step to control bleeding—apply direct pressure on wound
 - Applied by placing flat pads gloved fingers and applying fingertip pressure directly on point of bleeding

Mosby Items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

14

Types of Bleeding

- Bleeding control
 - Pressure points
 - Used to control bleeding if direct pressure, pressure dressings, and elevation do not work
 - Used only when a tourniquet is not readily available
 - Any place in extremity where artery can be compressed against bony surface—can be used as pressure point
 - Pressure point should be located at site between trunk of body and bleeding wound

Mosby Items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

15

Types of Bleeding

- Bleeding control
 - Tourniquets
 - Used to control life-threatening bleeding not controlled by other measures
 - If tourniquet must be used
 - Application is limited to control of bleeding from patient's arms and legs

Mosby Items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

16

Types of Bleeding

- Bleeding control
 - General rules for applying tourniquet include:
 - Use as wide a piece of material as possible
 - Apply material just above injury
 - Wrap material twice around site
 - Tie a knot in material
 - Place stick or other solid object on tip of knot
 - Try another knot over the placed object
 - Turn object to tighten material until bleeding is controlled
 - You may not be able to completely stop bleeding

Mosby Items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

17

Types of Bleeding

- Bleeding control
 - Note time tourniquet was applied
 - Write TK on patient's forehead along with time tourniquet was applied
 - Report presence of tourniquet to arriving EMS crew
 - Never release tourniquet once it has been placed
 - Once bleeding is controlled dress wound to prevent further contamination
 - Treat patient for shock

Mosby Items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

18

Skill 11-1 Control Bleeding

- Practice the steps to control external bleeding
 - Direct pressure
 - Elevation
 - Tourniquet
 - Bandage wound

Mosby Items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

19

Types of Bleeding

- Internal bleeding
 - Blood loss that occurs inside the body
 - Harder to identify and control
 - Causes range from tears in blood vessels to injured organs to musculoskeletal trauma
 - Minimal to life threatening
 - Be able to suspect internal bleeding based on
 - Mechanism of injury
 - Associated signs and symptoms
 - Should be suspected with any mechanism of injury involving blunt/penetrating trauma

Mosby Items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

20

Types of Bleeding

- Internal bleeding
 - Indicators of internal bleeding
 - Painful, swollen abdomen or extremity
 - Discolored
 - Tender
 - Swollen
 - Hard tissues

Mosby Items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

21

Types of Bleeding

- Internal bleeding
 - Symptoms of shock
 - Increased pulse rate
 - Increase respiratory rate
 - Pale, cool, moist skin
 - Altered mental status
 - Nausea and vomiting
 - Bleeding from any body orifice
 - Blood-tinged vomit or feces
 - "Coffee ground" vomit
 - Dark, tarry stool
 - Abdominal distention
 - Abdominal rigidity or tenderness

Mosby Items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

22

Shock

- Condition that results from decreased volume of circulating blood
 - Decreased supply of O_2 being delivered throughout body
 - If enough cells are deprived of an adequate amount of O_2 , tissue becomes damaged
 - If enough tissue is damaged, whole organs cannot function properly and internal organs begin to fail
 - Organ failure can progress rapidly to failure of one or more of the body's systems
 - Eventually entire body shuts down in response to system failure—death quickly follows

Mosby Items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

23

Shock

- Condition that develops over time
 - Time depends on extent and rate of circulatory failure
- Compensation
 - Attempt by body to stop shock from progressing

Mosby Items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

24

Shock

- Signs and symptoms
 - Restlessness and anxiety
 - Altered mental status
 - Pale, cool skin
 - Increased respiratory rate
 - Increased pulse rate
 - Nausea and vomiting
 - Thirst

Mosby items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

25

Skill 11-2 Signs and Symptoms of Shock

- Review the progression of shock
 - Obtain vital signs
 - Level of consciousness
 - Skin condition
 - Nausea & Vomiting
 - Progression of their vital signs and level of consciousness

Mosby items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

26

Shock

- Treatment
 - Position the patient
 - Supine position
 - Elevate feet no more than 12 inches off ground
 - Keep them warm!

Maintain airway, breathing, and circulation

- * Repeat assessment every 5 minutes
- * Provide high-flow oxygen at 10 LPM or more
- * Ensure external bleeding is controlled
- * Treat additional injuries as needed
- * Keep them calm

Mosby items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

27

Soft Tissue Wounds

- Interruption of skin or underlying tissue
- Priority
 - Control bleeding
 - Prevent further injury
 - Reduce chance of contamination or infection until physician can see patient

Mosby items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

28

Soft Tissue Wounds

- Closed wounds
 - No break in skin and no associated external bleeding
 - Contusion
 - Injury in which tissue under skin is damaged and blood vessels are torn
 - Generally an area of discoloration
 - Often associated with swelling and pain

Mosby items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

29

Soft Tissue Wounds

- Closed wounds
 - General management
 - May be nothing at all
 - Wound larger—can be treated with application of ice and elevation of body

Mosby items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

30

Soft Tissue Wounds

- Open wounds
 - Skin has been broken—associated bleeding
 - Abrasion
 - Most common
 - Generally a superficial soft tissue injury
 - Abrasion occurs when outermost layer of skin is damaged by something scraping against it
 - Usually painful

Mosby items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

31

Soft Tissue Wounds

- Open wounds
 - Laceration
 - Break in skin of varying depth and length
 - Can occur by itself or together with other lacerations or types of soft tissue injuries
 - Severity can range from paper cut to life-threatening wounds
 - Usually results from forceful impact with sharp object
 - Bleeding can be severe and may be either internal or external

Mosby items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

32

Soft Tissue Wounds

- Open wounds
 - Penetration or puncture
 - Generally caused by sharp, pointed object
 - May be little or no external bleeding
 - Internal bleeding may be severe
 - May not be detected until patient is exhibiting signs and symptoms of shock
 - Entrance and exit wounds need to have bleeding control

Mosby items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

33

Soft Tissue Wounds

Mosby items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

34

Soft Tissue Wounds

- Open wounds
 - Avulsion
 - Type of wound that occurs when piece of skin or soft tissue is partially torn loose or pulled completely off
 - Can be found anywhere on body
 - May be associated with other types of soft tissue wounds

Mosby items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

35

Soft Tissue Wounds

- Open wounds
 - Amputation
 - Separation of body part from rest of body
 - May involve large amount of bleeding

Mosby items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

36

Soft Tissue Wounds

- Open wounds
 - Management
 - Always protect yourself from exposure to body substances
 - Gloves
 - Eye protection
 - Face mask
 - Gown

Mosby items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

37

Soft Tissue Wounds

- Open wounds
 - Management
 - Steps for treating open soft tissue wounds
 - Expose wound and control bleeding
 - If bleeding is mild or stops, prevent wound from further contamination and cover with sterile dressing and bandage it securely in place

Mosby items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

38

Soft Tissue Wounds

- Open wounds
 - Management (dressing and bandaging)
 - Dressing
 - Protective/supporting covering that is placed on injured body part
 - Bandage
 - Holds dressing in place
 - Functions of dressings and bandages
 - Help stop bleeding
 - Prevent further damage to wound
 - Reduce contamination
 - Decrease risk of infection

Mosby items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

39

Soft Tissue Wounds

- Open wounds
 - Dressings are available in many forms
 - 4 × 4-inch gauze pads
 - Abdominal pads
 - Adhesive dressing
 - Occlusive dressings

Mosby items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

40

Soft Tissue Wounds

- Open wounds
 - Bandages also available in many forms
 - Self-adherent bandages
 - Gauze rolls
 - Triangular bandages
 - Adhesive tape

Mosby items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

41

Soft Tissue Wounds

- Open wounds
 - Management (dressing and bandaging)
 - General principles of dressing and bandaging:
 - Expose injured area
 - Place sterile dressing over entire injury
 - Maintain direct pressure to control any bleeding
 - Use bandage to secure dressing with some pressure
 - Do not remove bottom dressing in contact with wound

Mosby items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

42

Skill 11-3 Dressings and Bandages

Mosby items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

43

Skill 11-3 Dressings and Bandages

- An eye injury
 - Note that both eyes are covered for an eye injury to prevent further damage

Mosby items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

44

Soft Tissue Wounds

- Special considerations
 - Chest injuries
 - Injury to front, back, or side of chest between neck and upper abdomen
 - Require special treatment
 - Sucking chest wound
 - Hear air escaping from wound
 - See bubbles in blood outside wound

Mosby items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

45

Soft Tissue Wounds

- Special considerations
 - Occlusive dressing
 - Apply over chest wound
 - Dressing should not be sealed
 - Place patient on injured side or in semisitting position
 - Assess and treat patient for signs of shock

Mosby items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

46

Soft Tissue Wounds

- Special considerations
 - Eviscerations
 - Deep laceration through abdominal muscle wall that allows internal organs to protrude from abdomen
 - Organs may protrude from an opening in abdominal wall a small or large amount
 - Evisceration and skin around it typically do not bleed
 - Do not attempt to replace protruding organs inside abdomen

Mosby items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

47

Abdominal Evisceration

Mosby items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

48

Soft Tissue Wounds

- Special considerations
 - Impaled objects
 - May be both an entry and exit wound, or just entry wound
 - Leave object in wound and complete assessment
 - Expose wound area as much as possible without disturbing object
 - Control bleeding
 - Manually secure object
 - Assess and treat for signs of shock

Mosby items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

49

Soft Tissue Wounds

Mosby items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

50

Soft Tissue Wounds

- Special considerations
 - Amputations
 - Body may be able to control bleeding by clotting and contracting blood vessels
 - If amputation part is bleeding control bleeding using
 - Direct pressure and Elevation
 - Pressure dressing
 - Tourniquet
 - Once bleeding is controlled
 - Apply dressings and bandages to help prevent further contamination

Mosby items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

51

Soft Tissue Wounds

- Special considerations
 - Amputations
 - If amputated part can be located without compromising patient care
 - It should be preserved and sent with patient to hospital
 - Part should be rinsed, but not saturated with water
 - Part should be placed in sealed plastic bag by itself
 - Second bag/container should be filled with water and a few cubes of ice
 - Bag with amputated part should be placed into second bag/container holding water and ice
 - Never allow amputated body part to be submersed in water or placed directly on ice

Mosby items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

52

Soft Tissue Wounds

- Special considerations
 - Nosebleeds
 - Typically result of trauma
 - Most can be controlled with simple techniques
 - If patient is conscious and there is no indication of spinal injury
 - Have patient sit upright and lean slightly forward
 - Pinch nostrils together with gloved hand
 - Do not allow patient to snuffle or blow nose

Mosby items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

53

Soft Tissue Wounds

Mosby items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

54

Soft Tissue Wounds

- Special considerations

- Ear wounds

- If there is soft tissue wound to external ear
 - Apply dressings over ear and not in ear
 - Bandage dressings in place
 - Bleeding from ear should be considered a sign of head injury
 - Any fluid draining from ear may be cerebrospinal fluid

Soft Tissue Wounds

- Special considerations

- Eye wounds

- Cover both eyes even if only one is injured
 - Foreign body in eye
 - Dirt
 - Dust
 - Chemicals
 - Metal
 - Wood shaving

Soft Tissue Wounds

- Special considerations

- Eye wounds

- Patient may complain of :
 - Pain
 - Increased tearing
 - Blurred vision
 - Loss of vision

Soft Tissue Wounds

- Special considerations

- Eye wounds

- Before treatment
 - Ensure environment is safe
 - Ensure you are utilizing appropriate PPE
 - If no indication of spinal injury
 - Place patient in supine position with head slightly lower
 - Turn patient's head toward affected side
 - Using gloved hand—hold affected eye open with your fingers placed above and below eyelids
 - Flush eye for 15 minutes with sterile water
 - If object cannot be flushed out—bandage both eyes

Soft Tissue Wounds

- Burns

- Classified according to depth of burn in skin and other tissue

- Superficial burn
 - Involves only outer layer of skin
 - Partial-thickness burn
 - Involves outer and middle layers of skin
 - Cause deep, intense pain—nerve endings involved
 - Skin is reddened and usually has blisters
 - Patient will feel considerable pain

Soft Tissue Wounds

- Burns

- Full-thickness burns
 - Involve areas of charred or blackened skin, areas of redness, and blisters
 - Pain free—nerve endings in layers of skin have been destroyed
 - Generally associated with partial-thickness or superficial burns

Which is superficial, partial and full-thickness?

Mosby items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

61

Soft Tissue Wounds

- Burns
 - Extent of burn
 - Rule of nines—assessment tool that allows quick calculation of extent of burn
 - Body divided into segments that account for approximately 9% of total body surface area
 - Combining regions that are burned—estimate of extent of burn can be reached

Mosby items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

62

Soft Tissue Wounds

Mosby items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

63

Soft Tissue Wounds

- Burns
 - Critical burns
 - Burns are determined to be critical or noncritical depending on
 - Type
 - Extent
 - Location
 - Depth

Mosby items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

64

Soft Tissue Wounds

- Burns
 - Critical burns
 - Require immediate transport to burn center and include
 - Any burns involving the respiratory system
 - Partial-thickness burns over greater than 10% of body
 - Full-thickness burns
 - Burns that involve face, hand, feet, genitalia, major joints
 - Electrical burns
 - Chemical burns

Mosby items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

65

Thermal Burns

- Burns
 - Thermal burns
 - Initial treatment
 - Stop the burning process
 - Continually monitor airway to ensure it remains open
 - Hoarseness, shortness of breath, or any trouble breathing may indicate life-threatening injury
 - Prevent further contamination

Mosby items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

66

Thermal Burns

- Burns

- Thermal burns

- If a hand or foot is burned:
 - Separate fingers or toes with dressings
 - Ensure patient receives prompt transportation to hospital

Mosby Items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

67

Chemical Burns

- Chemical burns

- Consider all possible dangers when you arrive on the scene
 - Ensure safety of the scene before entering
 - Wear gloves and eye protection or other special clothing based on chemical involved

Mosby Items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

68

Chemical Burns

- Chemical burns

- Immediately brush any dry powder from patient
 - Flush area with large amounts of water for at least 10 minutes
 - Cover burned area with dry, sterile dressing
 - Splash injuries often involve eyes
 - Flush patient's eye with copious amounts of water for at least 20 minutes
 - Direct flow of water to outer corner of eye
 - Cover both eyes with dressing and bandage

Mosby Items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

69

Electrical Burns

- Electrical burns

- Ensure scene safety before approaching patient
 - Turn off electrical source
 - Never run to patient
 - Patient's internal injuries are often much worse than external injuries
 - Anticipate irregular heartbeat
 - Monitor patient closely for respiratory or cardiac arrest
 - Keep AED close to patient
 - Check for exit wound and entry wound

Mosby Items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

70

Special Populations

- Burn

- Infants and children

- Must be treated as pediatric patients
 - Pediatric patients have greater surface area compared to their total body volume
 - Keep environment warm—when possible
 - Consider possibility of child abuse
 - Evidence of possible abuse
 - Give to responding EMS crew and privately share your suspicions
 - Do not be confrontational with any patient, family member, or bystander on the scene

Mosby Items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

71

Questions?

Mosby Items and derived items © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

72
