

## Why choose Integrity Quality Management System (IQMS)

While quality management systems are used in many businesses to establish Quality Policy and Quality Objectives the effectiveness, sustainability and integrity of the implemented Quality Management Systems (QMS) significantly varies from business to business. Every customer within the Aerospace or Medical Industry knows the importance of a sustainable, reliable, effectively implemented, measured, monitored and maintained QMS that is focused on On-Time Delivery, Lot Acceptance and Customer Satisfaction.

The **AS9100** and **ISO13485** QMS requirements were designed by the Society of Automotive Engineers and the European Association of Aerospace Industries alongside the International Organization for Standards so there could be a standard that every manufacturer could agree on. The AS9100 and ISO13485 standard was designed with the focus on customer and regulatory compliance, product traceability (including subcontractors), configuration management, risk management and other aspects regarding the quality and safety that Aviation, Space, Defense and Medical companies need to ensure reliability, repeatability, performance of the final product.

Rather than asking the question what do we need to do to reach compliance one should ask what does compliance do for me?

An effectively fully implemented QMS must be capable of measuring the current ability to manufacture product that is conforming to all established acceptance requirements and delivered within the committed time frame as well as predict future trends and tendencies that might have an adverse effect on the sellable goods. Such a quality system, combined with a culture that is willing to change and a top management that is committed to invest into the future rather than looking for instant gratification, will build the foundation for a manufacturing platform that is capable of serving every market segment.

So whether your company designs product for **Aviation, Space and Defense** industries or is in the **Medical Industry** working with devices that are considered **High Risk** or **Mission Critical**, or simply is working with product for which **General Controls** alone are **insufficient** to assure product safety and effectiveness, it is crucial to ensure that every step of product realization is done in a controlled manner with a **partner** that is capable of managing and mitigating the responsibility and risks associated with producing high risk and high reliability product.

**IQMS** is a web based QMS developer and service provider focused on creating a new standard of effectiveness by implementing systems and methods that are based on integrity, visibility and compliance. Our approach to Quality is designed to enable individuals and partners to become and remain effective and competitive by ability rather than appearance.

*If you and your TEAM are looking for a partner that can help you get and stay compliant, than give us a call.*

*With best regards.*
