

**Baptist Village**  
**2023 Water Quality Report**  
**Georgia Water System ID #: GA2990016**

**Name of Water System Contact:**

**Jamie Boyett**  
**Jamie Boyett**

**Contact Phone Number:**

**Day: 912-283-1234**  
**Night: 912-218-7289**

**Summary of Water Quality Information**

The **Baptist Village** drinking water system is owned and operated by Baptist Village, Inc. The facility office is located at 2650 Carswell Avenue in Waycross, Georgia. If there are ever any comments or inquiries to be made, please feel free to visit the office or contact the facility manager, Jamie Boyett, at the number listed above.

Included in this report is information about where your water comes from, what it contains, and how it compares to standards set by regulatory agencies. **Baptist Village** is committed to providing their community with clean, safe, and reliable drinking water. For more information about your water or this report please call the water system contact listed above. **This report is available at the facility office upon request.**

Your water comes from two (2) community *groundwater* wells, referred to as well 101 and well 102. These wells extend into the *Coastal Plain Aquifer* to provide ample volumes of water for your community. Both wells are located on private property at 2650 Carswell Avenue in **Baptist Village** in Waycross, Georgia. Necessary treatment, such as removal of contaminants and chlorine disinfection, is performed at the well sites. This property is protected from activities which could potentially cause contamination of this water source.

A **Source Water Assessment Plan (SWAP)** for this facility has been completed by the Georgia Department of Natural Resources Environmental Protection Division (GA EPD). This is a report which identifies any types of pollution to which your water supply could be vulnerable and includes information regarding potential sources of contamination in your watershed. Currently there are no cited pollution sources for either well within their control zones, a fifteen (15) ft. perimeter around each well. Cited potential pollution sources for well 101 and well 102 within the management zone of 246 feet and 100 feet, respectively, include electrical transformers, utility poles, sewer lines, access and secondary roads, vehicle parking areas, dumpsters, an above ground storage tank, a maintenance area, an electrical sub-station, and storm water run-off potentially containing volatile organic compounds from parking areas and/or pesticides and herbicides from lawns. Based on these potential pollution sources, along with other information, well 101 is in the high susceptibility range for pollution and well 102 is considered to be in a medium susceptibility range for pollution. **The full SWAP is available at the facility office upon request.**

The **Baptist Village** water system is tested for more than eighty (80) drinking water parameters on a periodic basis determined by the GA EPD Drinking Water Program and/or the United States Environmental Protection Agency. Sample/testing schedules are based on initial contaminant level assessments and can be changed if deemed necessary. Waivers may be issued if data shows that the distributed drinking water in this area is not vulnerable to contamination from these chemicals. Generally, samples are taken from the **Baptist Village** water system for analyses of lead, copper, synthetic organic compounds, inorganic compounds, radionuclides, TTHMs, and HAA5s, once in a three (3) year cycle. Samples are also submitted annually for analysis of nitrate-nitrites and volatile organic compounds, and monthly for bacteriological content.

During 2023, samples were taken from the **Baptist Village** water system for the analyses of bacteriological content, nitrate-nitrites, volatile organic compounds, synthetic organic compounds, and radionuclides. **We are proud to inform you that Baptist Village did not have any violations of any water quality parameters during 2023. All detected contaminants are delineated in the accompanying chart. Any constituents not listed in the accompanying charts had results less than the detection limits.**

The results from the 2022 lead and copper monitoring event are included in the Water Quality Chart. For this event, samples were taken from five (5) representative locations from throughout the water system. **No** individual sample exceeded the lead or copper *Action Level*, however measurable quantities of lead and copper were detected in one or more samples. This indicates the presence of some service lines containing these contaminants.

Lead and copper are metals naturally found throughout the environment in soil and water. These metals can also be found in lead, copper, or brass household plumbing pipes and fixtures. Even consumer products such as paints, pottery, and pewter can contain lead and/or copper. Corrosion or deterioration of lead or copper-based materials, as well as erosion of natural deposits can release these metals into the drinking water.

*If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. Baptist Village is responsible for providing high quality drinking water but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at <http://www.epa.gov/safewater/lead>.*

**Additionally, the following measures may also be taken to minimize exposure to lead and/or copper:**

- Flush you tap for 30 seconds to 2 minutes when using water for drinking or cooking
- Use cold water for drinking or cooking
- Do not cook with or consume water from the hot water faucet
- Do not use hot water for making baby formula
- Use only “lead-free” solder, fluxes and materials in new household plumbing and repairs

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. **More information about contaminants and potential health effects can be obtained by calling the EPA’s Safe Drinking Water Hotline.**

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. **EPA/CDC guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the Safe Drinking Water Hotline at 800-426-4791.**

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity.

**Contaminants that may be present in source water include the following:**

- **Microbial contaminants**, such as viruses and bacteria which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- **Inorganic contaminants** such as salts and metals, which can be naturally occurring or result from urban storm runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.
- **Pesticides and herbicides**, which may come from a variety of sources such as agriculture, urban storm water runoff, and residential uses.
- **Organic chemical contaminants**, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, can also come from gas stations, urban storm water runoff, agricultural application, and septic systems.
- **Radioactive contaminants**, which can be naturally occurring or the result of oil and gas production and mining activities.

In order to ensure that tap water is safe to drink, EPA prescribes regulations which limit the amount of certain contaminants in water provided by public water systems. Food and Drug Administration regulations establish limits for contaminants in bottled water which must provide the same protection for public health.

**Baptist Village strives to maintain the highest standards of performance and quality possible. In order to maintain a safe and dependable water supply, improvements that benefit the community must be made. Please help keep these costs as low as possible by utilizing good water conservation practices.**

#### **DEFINITION OF TERMS AND ABBREVIATIONS USED IN THIS REPORT**

**Maximum Contaminant Level (MCL):** “The highest level of a contaminant that is allowed in drinking water. MCL’s are set as close to the MCLG as feasible using the best available treatment technology.”

**Maximum Contaminant Level Goal (MCLG):** “The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLG’s allow for a margin of safety.”

**Secondary Maximum Contaminant Level (SMCL):** reasonable goals for drinking water quality. Exceeding SMCL’s may adversely affect odor or appearance, but there is no known risk to human health.

**Treatment Technique (TT):** “A required process intended to reduce the level of a contaminant in drinking water.”

**TTHMs (Total Trihalomethanes):** One or more of the organic compounds Chloroform, Bromodichloromethane, Chlorodibromomethane, and/or Bromoform.

**HAA5s (Haloacetic Acids):** One or more of the organic compounds Monochloroacetic Acid, Dichloroacetic Acid, Trichloroacetic Acid, Monobromoacetic Acid, and Dibromoacetic Acid.

**BAPTIST VILLAGE  
2023 WATER QUALITY DATA  
WSID: GA2990016**

The table below lists all the drinking water contaminants that have been detected in your drinking water. The presence of these contaminants in the water does not necessarily indicate that the water poses a health risk. The data presented in this table is from testing done during the year noted. The Federal Environmental Protection Agency (EPA) and the Georgia Department of Natural Resources Environmental Protection Division (EPD) require monitoring for certain contaminants less than once per year because the concentrations of these contaminants are not expected to vary significantly from year to year. Parameters, values, and/or sources may vary.

DETECTED INORGANIC CONTAMINANTS TABLE								
Parameter	Units	MCL [SMCL]	MCLG	Baptist Village Water System Results	Range of Detections	Sample Date	Violation No/Yes	Typical Source of Contaminant
Iron	ppm	[0.3]	**	0.058	0.058 - 0.058	2022	No	Erosion of natural deposits
Barium	ppm	2	2	0.059	0.059 - 0.059	2022	No	Discharge of drilling wastes and metal refineries; erosion of natural deposits
Fluoride	ppm	4 [2]	4	0.41	0.41 - 0.41	2022	No	Erosion of natural deposits; water additive which promotes strong teeth
DETECTED ORGANIC CONTAMINANTS TABLE								
Parameter	Units	MCL	MCLG	Baptist Village Water System Results	Range of Detections	Sample Date	Violation No/Yes	Typical Source of Contaminant
Haloacetic Acids	ppb	60	**	3.30	3.30 to 3.30	2021	No	By product of drinking water disinfection
TTHMs	ppb	80	**	22.5	22.5 to 22.5	2021	No	By product of drinking water disinfection
OTHER DETECTED UNREGULATED CONTAMINANTS TABLE								
Parameter	Units	MCL [SMCL]	MCLG	Baptist Village Water System Results	Range of Detections	Sample Date	Violation No/Yes	Typical Source of Contaminant
Sodium	mg/l	**	**	55.5	22	2022	No	Erosion of natural deposits
DETECTED VOLATILE ORGANIC CONTAMINANTS TABLE								
Parameter	Units	MCL [SMCL]	MCLG	Baptist Village Water System Results	Range of Detections	Sample Date	Violation No/Yes	Typical Source of Contaminant
Xylenes, Total	ppm	10	10	0.0021	ND to 0.0021	2023	No	Discharge from petroleum and/or chemical factories
LEAD AND COPPER MONITORING RESULTS								
Parameter	Units	Action Level	MCLG	Baptist Village 90th Percentile	# of sample sites above AL	Sample Date	Violation No/Yes	Typical Source of Contaminant
Lead	ppb	15	0	0.00	0 of 5	2022	No	Corrosion of household plumbing
Copper	ppm	1.3	1.3	0.16	0 of 5	2022	No	Corrosion of household plumbing
MICROBIOLOGICAL MONITORING RESULTS								
Parameter	Units	MCL	MCLG	Baptist Village # of Positive Samples	Positive Sample Date (Month)	Sample Year	Violation No/Yes	Typical Source of Contaminant
Total Coliform	Present/	1*	0	0	N/A	2023	No	Naturally present in the environment
E. coli	Absent	0	0	0	N/A	2023	No	Human and animal fecal waste
RADIONUCLIDES TABLE								
Parameter	Units	MCL	MCLG	Baptist Village Water System Results	Range of Detections	Sample Date	Violation No/Yes	Typical Source of Contaminant
Alpha emitters	pCi/L	15	0	12.6	4.07 to 12.6	2023	No	Erosion of natural deposits
Combined Radium 226/228	pCi/L	5	0	2.79	1.18 to 2.79	2023	No	Erosion of natural deposits

\*Total Coliform Rule MCL= 1 positive sample for systems that collect <40 samples a month

\*\* No established MCL, SMCL or MCLG

•NA: Not applicable to this contaminant •ND (Not Detected): By regulation, this substance or group of substances was tested; however, none was detected at the testing limit.

•ppb (ug/L): parts per billion or micrograms per liter      •ppm (mg/L): parts per million or milligrams per liter      •pCi/l: picocuries per liter, a measurement of radiation

•Action Level (AL): "The concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow."
