

# Deployment

## Deployment of the DTD System

Each part of the DTD System is described in detail with instructions and procedures including examples for setup and usage of the components of the system.

The DTD System is developed so that the core database and processes are deployed in a department that will be the hub of the system. It is recommended that company personnel that will be administering the system should be the personnel customizing the system and working with department personnel inside the company to integrate the system processes into their respective departments.

The DTD System is designed to be deployed onsite by Company Personnel. If requested DTD System personnel can offer assistance in the system deployment, familiarity with the processes, recommendations in customizing the system and providing advice for bringing prospective users into the system.
