Build A House

If the software is not on your computer, then go to:

Nchsoftware.com/design/index.html

House must be a reasonable size, and have reasonable things you might have for a house.

Once it is done, I will want to know cost for things.

I want you to pick a type of flooring for your house (carpet, tile, wood, whatever). Then find the price for it. Then find out how much to do your entire house.

I want you to find the price of paint, and figure out how much you are going to have to spend to paint your house. Inside and outside. They are different paints and different prices.

I want you to figure out how big an air conditioner you will need to buy. Ac is measured in tonnage. You need a certain amount of tons per cubic square foot. This means that you will need to find out the volume of your house to find the amount of ac you need.

I also want you to figure out how much it costs for roofing and find out how much you will have to spend on your roof.

Then, put all these prices and calculations together with your house pictures and blueprints so that we can see your splendid home and appreciate how awesome it is. You can make this into a slide show or a poster, choice is yours.
