Weather Update

The Main Stream Media have been broadcasting any regions clocking heat waves as signaling that the Earth is “Going to Fry”. By way of perspective, we have from time to time assembled charts or reports showing that the latter is not happening. Yes, there have been heat waves reported in both Hemispheres, but these have been sensationalized. Over the last couple of years, we have noted weather headlines of unusual cold spells in both Hemispheres.

Sites independent of climate hysteria have been providing more rational reporting. And the number of such sites has been growing. One can't help but think of when the Cold War was on. BBC, Voice of America and Radio Free Europe broadcast straight up news as well as stuff on how good life was in the “free world”. Communist governments with a monopoly on media touted how wonderful life was with their absolute control. Until the locals finally reached a point where they could not believe it anymore and took down the Berlin Wall.

Freedom and prosperity invaded Communist countries.

Now authoritarianism is not just regional but becoming ambitious most everywhere. From positions of control by urban socialists in all large cities in the Western World. And, ironically, the propaganda has been just how bad life will be in the Western World without their absolute control.

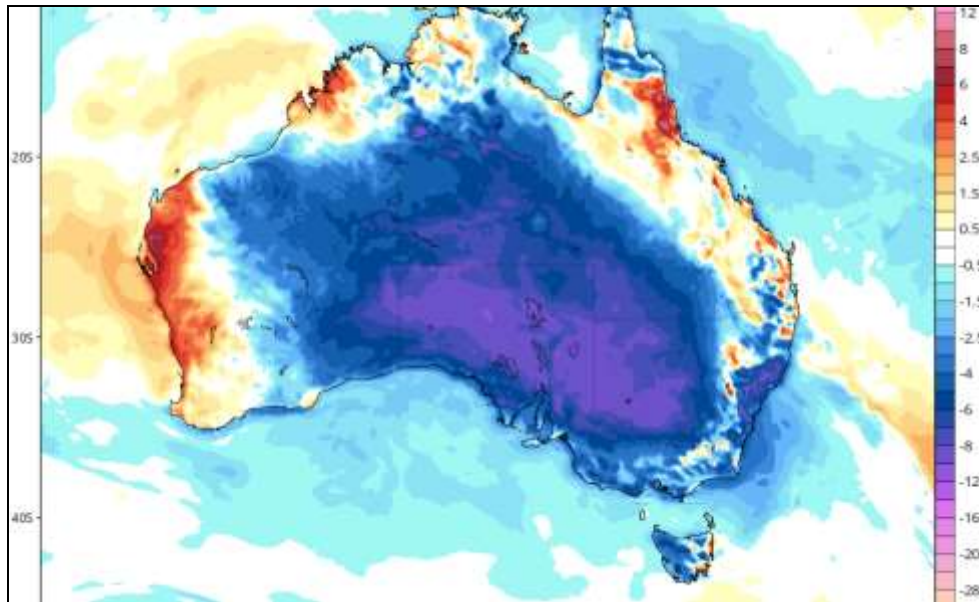

However, by publishing straight stuff on weather and climate there are sites bypassing the propaganda.

And this fall in the Northern Hemisphere there has been early frosts and snow. From the Rocky Mountains to the Urals, locals just have to look out their windows to see what's happening.

First, a headline from Southern Australia on October 28th:

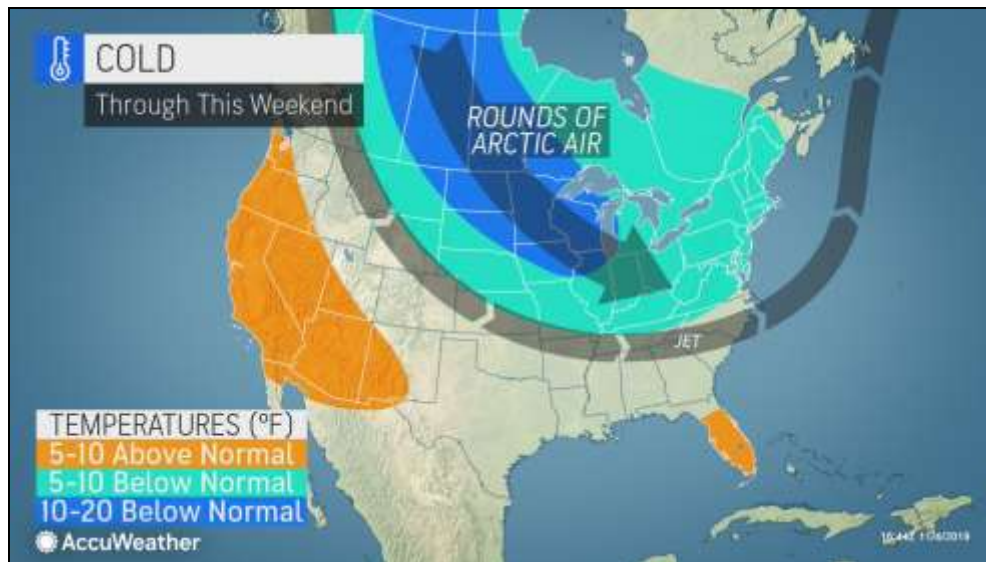

“100 + Year Cold Records Broken In Australia”

Then, this week's temperature map:

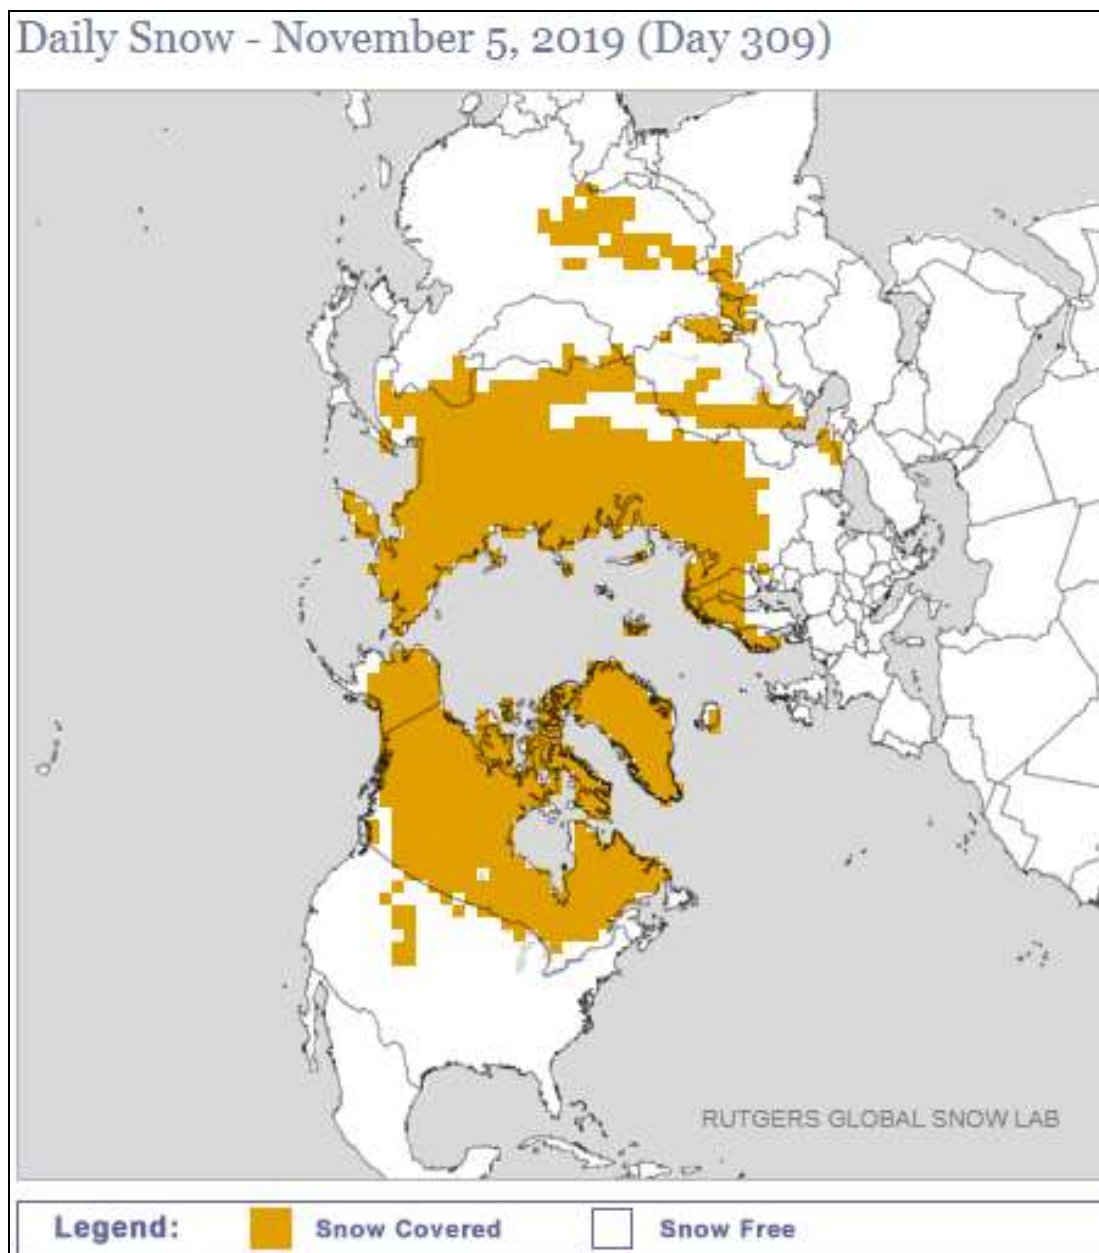

Source: Electroverse.net

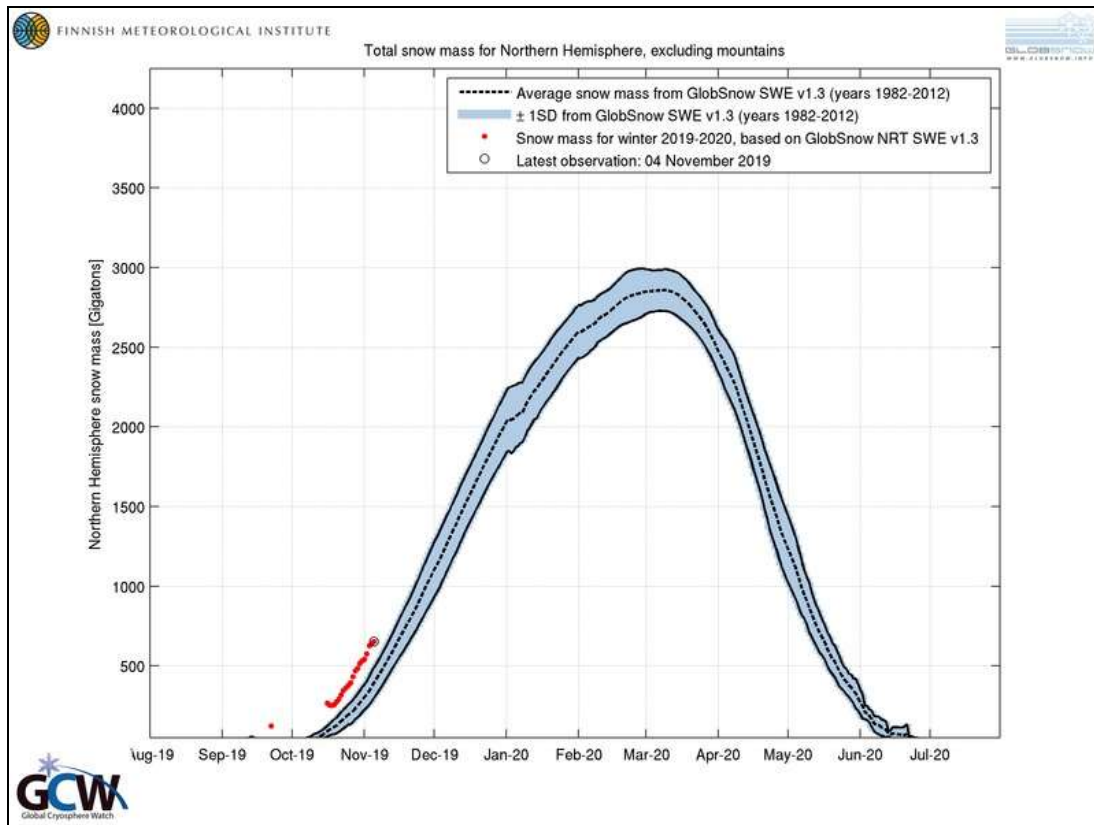

Second is the weather map for North America for this coming weekend:

And then there is the unusual amount of snow so early in the season. This is what's happening with snow cover:

And to wrap this one up, there is the chart showing the amount of snow accumulating in the Northern Hemisphere.

Climate hysterians have been calling for heat and drought. The Solar Cycle has been anticipating cooling, increasing cloud cover and precipitation.
