

## Proper Bleeding of Hydraulic Lines

*Specific System:* Two Point Slave System Installation

### Recommended bleeding process:

Prior to hooking up both slave leg hydraulic lines; **install the retract line only, leave the extend line un-attached at the slave leg and place the line in a container** (the same container used for filling the reservoir works well). After filling the reservoir and temporarily installing the controls and power, **press the extend button on the control to extend the jacks for a moment until the container starts to be filled with the fluid from the slave leg's extend line. This means all the air is removed from that line and cannot be internally trapped in the system.** Install the extend line to the slave leg and continue to run the jacks to full extension for a moment and back down again. Process complete!
