

Class  
Topper

THIS IS YOUR  
BRAIN ON JOY

**AMAZING MATH SHORTCUTS**

Stump your friends and family...  
It's easy with ClassTopper!

**M**ath is Ubiquitous

We love to hate Math but we also know Math is everywhere.

Math skills are important to a child's success – both at school and in everyday life. Understanding math also builds confidence and opens the door to a range of career options.

So how can we help our kids get better at Maths? At school, children learn the concepts and skills identified for each grade. But as every parent knows learning it at schools alone just isn't enough. We wanted to help kids improve their math skills so we created

***ClassTopper***

ClassTopper.com is a remarkable way for kids to engage with maths, master new skills and keep track of their progress. Using novel, engaging and constantly adapting challenges, our exercises target cognitive areas such as ***memory, attention*** and ***processing speed***.

There are over ***2000 skills*** in every skills imaginable spanning ***pre-kindergarten*** to ***tenth grade*** math. And it's aligned to global ***international curriculums*** so you don't miss a thing.

And for parents, there's nothing quite like being able to pull up a dashboard on a laptop or desktop and quickly figure out exactly where the child stands, and what enrichment is needed to get him or her up to speed. Our automated monitoring and assessment tools do just that.

Oh! And we don't believe our Schools should have to pay for technology to help their students succeed in life. So we made sure it's free for all schools and teachers. We are socially good!

On seeing this kind of work actually being performed by the little children, the doctors, professors and other “big guns” of mathematics are wonder-struck and exclaim:

**‘Is this mathematics or magic?’**

And we invariably answer and say: ‘It is both. It is magic until you understand it; and it is mathematics thereafter’...

Bharati Krsna Tirthaji  
Vedic Mathematics Scholar

## INTRODUCTION

Ten-year old Truman Henry Safford (born 1836) was asked:

“Multiply in your head  
365,365,365,365,365,365  
by  
365,365,365,365,365,365.”

He flew around the room like a top, pulled his pantaloons over the top of his boots, bit his hand, rolled his eyes in their sockets, sometimes smiling and talking, and then seeming to be in an agony, until, in not more than one minute, said he,

“133,491,850,208,566,925,016,658,299,941,583,225!”

‘Lightning calculators’, are not that uncommon and while we may not be able to match the brilliance of a Truman Henry Safford, we can all develop, with the aid of this book, a talent at mental mathematics.

With these super-easy methods you need no longer be

caught between the drudgery of the old dinosaur methods and the ‘cop-out’ of the calculator. When Bharati Krsna Tirthaji reconstructed the ancient system of Vedic Maths (used in this book) earlier this century, he uncovered a beautifully integrated and complete system of maths which had been lost for centuries. The Vedic system mirrors the way the mind naturally works and so is designed to be done mentally.

*Fun with Figures* is for those who think they are not good at maths – and for those who are good at maths. It is for those who would like to steal a little lightning. The book answers a need of our time, offering easy, enjoyable maths which improves mental agility and memory, promotes confidence and creativity – as well as being useful in everyday life.

Each double page shows a simple mathematical method and is independent of the others (with two exceptions, which are indicated). In addition to the various everyday situations indicated in this book, you will surely find many other occasions for the use of these easy methods. There are many exercises for you to practise and answers at the end of the book.

## AMAZE YOUR FRIENDS

Use the formula **ALL FROM 9 AND THE LAST FROM 10** to amaze your friends with instant subtractions.

- For example  $1000 - 357 = \underline{643}$

We simply take each figure in 357 from 9 and the last figure from 10:

$$\begin{array}{ccccccc} 1 & 0 & 0 & 0 & - & 3 & 5 & 7 \\ & & & & & \downarrow & \downarrow & \downarrow \\ & & & & & \text{from 9} & \text{from 9} & \text{from 10} \\ & & & & = & 6 & 4 & 3 \end{array}$$

So the answer is  $1000 - 357 = \underline{643}$

*And that's all there is to it!*

This always works for subtractions from numbers consisting of a 1 followed by noughts: 100; 1000; 10,000 etc.

- Similarly  $10,000 - 1049 = \underline{8951}$

$$\begin{array}{rcccccccc} 1 & 0 & , & 0 & 0 & 0 & - & 1 & 0 & 4 & 9 \\ & & & & & & & \downarrow & \downarrow & \downarrow & \downarrow \\ & & & & & & & \text{from 9} & \text{from 9} & \text{from 9} & \text{from 10} \\ & & & & & & & \downarrow & \downarrow & \downarrow & \downarrow \\ = & 8 & & 9 & & 5 & & 1 & & & \end{array}$$

- For  $1000 - 83$ , in which we have more zeros than figures in the numbers being subtracted, we simply suppose that 83 is 083.

So  $1000 - 83$  becomes  $1000 - 083 = \underline{917}$

*Try some yourself:*

- 1)  $1000 - 777 =$
- 2)  $1000 - 283 =$
- 3)  $1000 - 505 =$
- 4)  $10,000 - 2345 =$
- 5)  $10000 - 9876 =$
- 6)  $10,000 - 1101 =$
- 7)  $100 - 57 =$
- 8)  $1000 - 57 =$
- 9)  $10,000 - 321 =$
- 10)  $10,000 - 38 =$

*Mathematics, rightly viewed, possesses not only truth but supreme beauty . . .*

BERTRAND RUSSELL

## IN THE SHOP

*Instantly find the change due from \$10 or \$20*

- Suppose you buy something for \$3.33 and you give a \$10 note. How much change would you expect to get?

You just apply ALL FROM 9 AND THE LAST FROM 10 to the \$3.33 and you get \$6.67:

$$\begin{array}{r}
 10 - 3.33 \\
 \phantom{10} \quad \downarrow \quad \downarrow \quad \downarrow \\
 \phantom{10} \quad \text{from 9} \quad \text{from 9} \quad \text{from 10} \\
 \hline
 = 6.67
 \end{array}$$

■  $\$10 - \$2.30 = \underline{\$7.70}$

Here “the last” is the 3 as zero does not count.  
So we take 2 from 9 and 3 from 10.

*Try these:*

1)  $\$10 - \$7.77 =$

2)  $\$10 - \$4.44 =$

3)  $\$10 - \$6.36 =$

4)  $\$10 - \$5.67 =$

5)  $\$100 - \$84.24 =$

6)  $\$100 - \$31.33 =$

*Zerah Colburn (1804-40), when he was eight, was asked to raise the number 8 to the sixteenth power: he announced the answer (281,474,976,710,656) “promptly and with facility”, causing the academic audience to weep. He was next asked to raise the numbers 2,3, . . . 9 to the 10th power: and he gave the answers so rapidly that the gentleman who was taking them down was obliged to ask him to repeat them more slowly.*

## TABLES MAGIC

*Don't know your tables? Never mind, in this system you don't need them beyond 5 x 5!*

- Suppose you need **8 x 7**

8 is 2 below 10 and 7 is 3 below 10.

Think of it like this:

$$\begin{array}{r} 8 \quad 2 \\ 7 \quad 3 \\ \hline 5 \quad 6 \end{array} \text{ answer}$$

The answer is 56.

The diagram below shows how you get it.

$$\begin{array}{r} 8 \quad 2 \\ | \times | \\ 7 \quad 3 \\ \hline 5 \quad 6 \end{array} \text{ answer}$$

You subtract crosswise:  $8 - 3$  or  $7 - 2$  to get **5**, the first figure of the answer.

And you multiply vertically:  $2 \times 3$  to get **6**, the last figure of the answer.

*That's all you do:*

see how far the numbers are below 10, subtract one number's deficiency from the other number, and multiply the deficiencies together.

■  $7 \times 6 = \underline{42}$

$$\begin{array}{r} 7 \quad \times \quad 3 \\ \hline 6 \quad 4 \\ 3 \quad \underline{12} \\ \hline 42 \end{array}$$

Here there is a carry: the 1 in the 12 goes over to make the 3 into 4.

*Multiply these:*

1) $\begin{array}{r} 8 \\ 8 \\ - \end{array}$	2) $\begin{array}{r} 9 \\ 7 \\ - \end{array}$	3) $\begin{array}{r} 8 \\ 9 \\ - \end{array}$	4) $\begin{array}{r} 7 \\ 7 \\ - \end{array}$	5) $\begin{array}{r} 9 \\ 9 \\ - \end{array}$	6) $\begin{array}{r} 6 \\ 6 \\ - \end{array}$
---	---	---	---	---	---

*The whole heaven is number  
and harmony*

ARISTOTLE

## AT A PARTY

*At a party surprise your friends with this spectacular way of multiplying large numbers together in your head.*

Here's how to use VERTICALLY AND CROSSWISE for multiplying numbers close to 100.

- Suppose you want to **multiply 88 by 98**.

Not easy, you might think. But with VERTICALLY AND CROSSWISE you can give the answer immediately, using the same method as on the last page.

Both 88 and 98 are close to 100.

88 is 12 below 100 and 98 is 2 below 100.

You can imagine the sum set out like this:

$$\begin{array}{r} 88 - 12 \\ | \times | \\ \hline 98 - 2 \\ \hline \underline{86 \quad 24} \end{array}$$

As before the **86** comes from subtracting crosswise:  $88 - 2 = 86$  (or  $98 - 12 = 86$ : you can subtract either way, you will always get the same answer).

And the **24** in the answer is just  $12 \times 2$ : you multiply vertically.

So  **$88 \times 98 = 8624$**

*This is so easy it is just mental arithmetic.*

*Try some:*

- |           |           |           |           |           |           |           |
|-----------|-----------|-----------|-----------|-----------|-----------|-----------|
| 1) 87     | 2) 88     | 3) 77     | 4) 93     | 5) 94     | 6) 64     | 7) 98     |
| <u>98</u> | <u>97</u> | <u>98</u> | <u>96</u> | <u>92</u> | <u>99</u> | <u>97</u> |
| —         | —         | —         | —         | —         | —         | —         |

*Where there is life there is  
pattern and where there is  
pattern there is mathematics*

JOHN D. BARROW

## EXERCISE YOUR BRAIN CELLS

*While waiting in a queue, why not exercise your brain cells by multiplying numbers just over 100.*

■  **$103 \times 104 = \underline{10712}$**

The answer is in two parts: 107 and 12.  
107 is just  $103 + 4$  (or  $104 + 3$ ),  
and 12 is just  $3 \times 4$ .

■ Similarly  **$107 \times 106 = \underline{11342}$**

$107 + 6 = 113$  and  $7 \times 6 = 42$

*Again, just mental arithmetic.*

Try a few:

1)  $102 \times 107$

3)  $104 \times 104$

5)  $101 \times 123$

2)  $106 \times 103$

4)  $109 \times 108$

6)  $103 \times 102$

*I proposed to him [Jedediah Buxton, 1702-72] the following random question: In a body whose 3 sides are 23,145,789 yards, 5,642,732*

*yards, and 54,965 yards, how many cubical eighths of an inch? After once naming the several figures distinctly, one after another, in order to assure himself of the several dimensions and fix them in his mind, without more ado he fell to work amidst more than 100 of his fellow laborers, and after leaving him about 5 hours, on some necessary concerns (in which time I calculated it with my pen) at my return, he told me he was ready: upon which, taking out my pocket book and pencil, to note down his answer, he asked which end I would begin at, for he would direct me either way . . . I chose the regular method . . . and in a line of 28 figures, he made no hesitation nor the least mistake.*

SHOW YOUR CLASS

*Teacher – show your class the easy way to add and subtract fractions.*

Use VERTICALLY AND CROSSWISE to write the answer straight down!

■  $\frac{2}{3} + \frac{1}{5} = \frac{10 + 3}{15} = \frac{13}{15}$

Multiply crosswise and add to get the top of the answer:

$2 \times 5 = 10$  and  $1 \times 3 = 3$ . Then  $10 + 3 = 13$ .

The bottom of the fraction is just  $3 \times 5 = 15$ .

You multiply the bottom numbers together.

So:

$$\blacksquare \frac{5}{7} + \frac{3}{4} = \frac{20 + 21}{28} = \frac{41}{28}$$

Subtracting is just as easy: multiply crosswise as before, but then subtract:

$$\blacksquare \frac{6}{7} - \frac{2}{3} = \frac{18 - 14}{21} = \frac{4}{21}$$

*Try a few:*

$$1) \frac{4}{5} + \frac{1}{6} = \quad 2) \frac{1}{3} + \frac{1}{4} = \quad 3) \frac{2}{7} + \frac{2}{3} =$$

$$4) \frac{4}{5} - \frac{1}{6} = \quad 5) \frac{1}{4} - \frac{1}{5} = \quad 6) \frac{8}{3} - \frac{9}{5} =$$

*... nature is the realisation of the simplest conceivable mathematical ideas.*

EINSTEIN

ON A WALK

*Out walking with your friends, show them this quick way to square numbers that end in 5 using the formula **BY ONE MORE THAN THE ONE BEFORE**.*

■  $75^2 = \underline{5625}$

$75^2$  means  $75 \times 75$ .

The answer is in two parts: 56 and 25.

The last part is always **25**.

The first part is the first number, 7, multiplied by the number “one more”, which is 8:

so  $7 \times 8 = 56$

$$75^2 = 5625$$

*(An orange arrow points from the 7 to the 56, and another orange arrow points from the 8 to the 25, with the text  $7 \times 8 = 56$  below.)*

- Similarly  $85^2 = \underline{7225}$  because  $8 \times 9 = 72$ .

*Try these:*

- 1)  $45^2$     2)  $65^2$     3)  $95^2$     4)  $35^2$     5)  $15^2$

*For the harmony of the world is made manifest in Form and Number, and the heart and soul and all the poetry of Natural Philosophy are embodied in the*

*concept of mathematical beauty.*

D'ARCY THOMPSON

## AT THE OFFICE

*Show your colleagues in the office this beautiful method for multiplying numbers where the first figures are the same and the last figures add up to 10.*

■  $32 \times 38 = \underline{1216}$

Both numbers here start with 3 and the last figures (2 and 8) add up to 10.

So we just multiply 3 by 4 (the next number up) to get **12** for the first part of the answer.

And we multiply the last figures:  $2 \times 8 = \mathbf{16}$  to get the last part of the answer.

Diagrammatically:

$$\begin{array}{r} 32 \\ \times 38 \\ \hline 1216 \end{array}$$

Diagram illustrating the multiplication  $32 \times 38 = 1216$ . The partial products are shown as  $2 \times 8 = 16$  and  $3 \times 4 = 12$ , with arrows indicating their placement in the final result.

■ And  $81 \times 89 = \underline{7209}$

We put 09 since we need two figures as in all the other examples.

*Practise some:*

1)  $43 \times 47 =$

2)  $24 \times 26 =$

3)  $62 \times 68 =$

4)  $17 \times 13 =$

5)  $59 \times 51 =$

6)  $77 \times 73 =$

*The mathematician does not study pure mathematics because it is useful; he studies it because he delights in it and he delights in it because it is beautiful.*

POINCARÉ

## ON THE MOTORWAY

*On a car journey, get the children to find the digit sum of car number plates.*

Any number of any size can always be reduced to a single figure by adding its digits.

- For example 42 has two digits which add up to 6. We say “the digit sum of 42 is 6”.
- The digit sum of 413 is 8 because  $4 + 1 + 3 = 8$ .
- For 20511 the digit sum is 9.

*Try a few:*

- 1) 34    2) 61    3) 303    4) 3041    5) 21212

- Now suppose we want the digit sum of 417. Adding 4, 1 and 7 gives 12. But as 12 is a 2-figure number we add its digits to get 3 ( $1 + 2 = 3$ ).

We could write  $417 = 12 = 3$ .

- And so  $737 = 17 = 8$ .

We simply add the digits in the number and add again if necessary.

This is simple and one of its uses is in checking sums, as we will see.

*Find the digit sum for each of the following:*

- 1) 85    2) 38    3) 77    4) 99    5) 616    6) 7654

*All things that can be known have number; for it is not possible that without numbers anything can be either conceived or known.*

PHILOLAUS

## THE NINE-POINT CIRCLE

Since all numbers, no matter how long, can be reduced to a single figure, see page 24, every number finds its place on the nine-point circle:

This circle shows the numbers from 1 to 9 and continuing to number round the circle would put 10 at the same place as 1. 11 would be at the same place as 2 and so on as shown below:

Notice also that 0 goes at the same place as 9 because, numbering backwards round the circle, 0 comes before 1.

So all numbers will have their place somewhere round this circle.

Now, looking at the last circle, the digit sum of 10 is 1, and 10 is next to 1 on the circle.

The digit sum of 11 is 2, and 11 is next to 2.

And so on.

To find which branch of the circle a number is on we simply find its digit sum.

- For example the digit sum of 34 is 7 so 34 will come on the '7 branch'.

You could check this by continuing to number round the circle until you get to 34.

- 77 will be on the '5 branch' as  $77 = 14 = 5$ .

*Put these numbers on the correct branch of the circle:*

1) 88

2) 373

3) 555

4) 67348

## IN YOUR MATHS LESSON

*Why not check your sums by this fascinating method using digit sums.*

- Suppose you want to check that the simple addition sum below is correct.

$$\begin{array}{r} 4 \quad 3 \\ 3 \quad 2 \\ \hline 7 \quad 5 \end{array} +$$

We find the digit sum of 43, 32 and 75 and check that the first two digit sums add up to the third digit sum:

$$\begin{array}{r} 4 \quad 3 \\ 3 \quad 2 \\ \hline 7 \quad 5 \end{array} + \quad \begin{array}{r} 7 \\ 5 \\ \hline 3 \end{array} +$$

The digit sums are shown on the right and  $7 + 5 = 3$  is correct in digit sums because  $7 + 5 = 12 = 3$  ( $1 + 2 = 3$ ).

This indicates that the answer is correct.

All sums, even the most complex, can be checked in this way.

*Check the following sums and find out which are wrong:*

1) 56	2) 83	3) 77	4) 545	5) 357
$\frac{88}{144} +$	$\frac{38}{121} +$	$\frac{69}{156} +$	$\frac{273}{818} +$	$\frac{753}{1010} +$

It is worth noting (in case you want to check subtraction sums using the nine-point circle) that in digit sums  $7 - 5 = 2$ ,  $6 - 6 = 0$  and so on, but  $3 - 4 = 8$ . You can see this on the circle by starting at 3 and going 4 jumps backwards round the circle. Alternatively, you can add 9 to the 3 so that  $3 - 4$  becomes  $12 - 4$ , which is 8.

*The advancement and perfection of Mathematics are intimately connected with the prosperity of the state.*

NAPOLEON

## CHECK YOUR BILL

*Use this easy method of adding numbers to check your bank statement or supermarket bill.*

The usual way to add numbers works from right to left, and so is not useful for mental maths. Numbers are written and spoken from left to right and so it is easier to work from left to right especially when doing calculations in your head.

■  **$34 + 52 = 86$**

This is easy to do from left to right.

We add 3 and 5 to get 8.

And we add 4 and 2 to get 6.

*Just practise one or two:*

1)  $44 + 34 =$       2)  $52 + 37 =$       3)  $246 + 642 =$

You can use the digit sum method to check these.

Now suppose that there is a carry figure.

■  $76 + 86 = \underline{162}$

The figures on the left add up to  $7 + 8 = 15$ .

The figures on the right add up to  $6 + 6 = 12$ .

$$\begin{array}{r} 1 \ 5 \\ + \ 1 \ 2 \\ \hline 1 \ 6 \ 2 \end{array}$$

Now as 12 is a 2-figure number the 1 will be carried over to make the 15 into 16, giving 162.

This is easy to do in your head—for any 2-figure number carry the left-hand figure to the left.

■  $373 + 474 = \underline{847}$

First we get 7.

Then we get 14:  $7 \ 1 \ 4 = 84$ .

Finally we get 7 which gives **847**.

*Try these:*

1)  $44 + 77 =$

2)  $87 + 86 =$

3)  $28 + 38 =$

4)  $65 + 56 =$

5)  $464 + 262 =$

6)  $773 + 883 =$

7)  $177 + 277 =$

## CHECK YOUR CHANGE

*Using **BY SUBTRACTION AND BY ADDITION** you can easily check your change.*

Suppose you offer 50p for something costing 18p.

■  $50 - 18 = \underline{32}$

To take 18 from 50, we note that 18 is close to 20, so we take 20 away from 50 (to get 30) and add 2 back on.

- Similarly in  $73 - 49$  we decide to take 50 away from 73 and then add 1 back on. We get 24.

Try these:

- 1)  $62$       2)  $84$       3)  $71$       4)  $43$       5)  $55$   
36 -      48 -      27 -      16 -      28 -  
—            —            —            —            —

*Behold the heaven, the earth, the sea; all that is bright in them or above them; all that creep or fly or swim; all have forms because all have number. Take away number and they will be nothing...*

ST AUGUSTINE

## IN THE DIY SHOP

*This astonishing method for multiplying numbers is so easy because it works from left to right*

Suppose you want to know the cost of 6 hinges at 73c each.

■  $73 \times 6 = \underline{438}$

We first multiply the 7 by 6 to get 42.

We then multiply the 3 by 6 to get 18.

$$42 \text{ } 18 = 438$$

The 1 in the 18 is mentally carried back to the 42 to make it 43.

So any double figure number after the first involves carrying the first figure to the left and adding it on.

- Similarly  $234 \times 7 = \underline{1638}$

We get  $2 \times 7 = 14$  then  $3 \times 7 = 21$   
and  $14 \text{ } 21 = 161$

Next we have  $4 \times 7 = 28$ , so  $161 \text{ } 28 = 1638$

- $282 \times 4 = \underline{1128}$

As  $8 \text{ } 32 = 112$  and  $112 \text{ } 8 = 1128$

- And  $43 \times 7 = 2821 = \underline{301}$  (28 becomes 30)

*Try a few of these:*

- |                    |                     |                     |
|--------------------|---------------------|---------------------|
| 1) $56 \times 6 =$ | 2) $43 \times 4 =$  | 3) $77 \times 5 =$  |
| 4) $88 \times 9 =$ | 5) $66 \times 7 =$  | 6) $18 \times 8 =$  |
| 7) $45 \times 7 =$ | 8) $444 \times 3 =$ | 9) $383 \times 7 =$ |

*Mathematics is the  
Queen of the Sciences  
and Arithmetic the  
Queen of Mathematics.*

## HAVE A BREAK

### NOT-SO-LONG MULTIPLICATION

*At break time at school or in the office try out this elegant way of multiplying numbers using a simple pattern.*

■  $21 \times 23 = \underline{483}$

This is normally called long multiplication but actually the answer can be written straight down using the **VERTICALLY AND CROSSWISE** formula.

We first put, or imagine, 23 below 21:

$$\begin{array}{r} 2 \quad 1 \\ | \times | \\ \hline 2 \quad 3 \\ \hline 4 \quad 8 \quad 3 \end{array}$$

There are 3 steps:

a) Multiply **vertically on the left**:  $2 \times 2 = 4$ .

This gives the first figure of the answer.

- b) Multiply **crosswise and add**:  $2 \times 3 + 1 \times 2 = 8$   
This gives the middle figure.
- c) Multiply **vertically on the right**:  $1 \times 3 = 3$   
This gives the last figure of the answer.

*And that's all there is to it.*

- Similarly  $61 \times 31 = \underline{1891}$

$$\begin{array}{r} 6 \quad 1 \\ | \times | \\ 3 \quad 1 \\ \hline 18 \quad 9 \quad 1 \end{array}$$

$$6 \times 3 = 18; \quad 6 \times 1 + 1 \times 3 = 9; \quad 1 \times 1 = 1$$

*Try these, just write down the answer:*

1) 14	2) 22	3) 21	4) 21	5) 32
21	31	31	22	21
—	—	—	—	—
—	—	—	—	—

This method is extended on the next page.

*The creative principle resides  
in mathematics.*

EINSTEIN

## AT THE POST OFFICE

*Multiply any 2-figure numbers together by mere mental arithmetic!*

If you want 21 stamps at 26 cents each you can easily find the total price in your head.

There were no carries in the method given on the previous page. However, these only involve one small extra step.

■  $21 \times 26 = \underline{546}$

$$\begin{array}{r} 21 \\ \times 26 \\ \hline 126 \\ 420 \\ \hline 546 \end{array} = \underline{546}$$

The method is the same as on the previous page except that we get a 2-figure number, 14, in the middle step, so the 1 is carried over to the left (4 becomes 5).

So 21 stamps cost \$5.46.

Practise a few:

1) 21	2) 23	3) 32	4) 42	5) 71
<u>47</u>	<u>43</u>	<u>53</u>	<u>32</u>	<u>72</u>
—	—	—	—	—

■ **33 x 44 = 1452**

There may be more than one carry in a sum:

$$\begin{array}{r}
 3 \quad 3 \\
 | \quad \times \quad | \\
 4 \quad 4 \\
 \hline
 12 \quad 24 \quad 12 \\
 \hline
 = \quad 1452
 \end{array}$$

Vertically on the left we get 12.

Crosswise gives us 24, so we carry 2 to the left and mentally get 144.

Then vertically on the right we get 12 and the 1 here is carried over to the 144 to make 1452.

6) 32	7) 32	8) 31	9) 44	10) 54
<u>56</u>	<u>54</u>	<u>72</u>	<u>53</u>	<u>64</u>
—	—	—	—	—

Any two numbers, no matter how big, can be multiplied in one line by this method.

## IMPRESS YOUR PARENTS

*Multiplying a number by 11 is incredibly easy – astonish your parents and friends with this.*

To multiply any 2-figure number by 11 we just put the total of the two figures between the 2 figures.

■  $26 \times 11 = \underline{286}$

$$\begin{array}{c} \text{26} \times \text{11} = \text{286} \\ \qquad \qquad \qquad \downarrow \\ \qquad \qquad \qquad 2 + 6 = 8 \end{array}$$

Notice that the outer figures in 286 are the 26 being multiplied.

And the middle figure is just 2 and 6 added up.

■ So  $72 \times 11 = \underline{792}$

*Multiply by 11:*

- 1) 43    2) 81    3) 15    4) 44    5) 11

■  $77 \times 11 = \underline{847}$

This involves a carry figure because  $7 + 7 = 14$

We get  $77 \times 11 = 7_147 = 847$ .

*Multiply by 11:*

- 6) 88    7) 84    8) 48    9) 73    10) 56

■  $234 \times 11 = \underline{2574}$

We put the **2** and the **4** at the ends.

We add the first pair:  $2 + 3 = 5$ ,

and we add the last pair:  $3 + 4 = 7$ .

Several multiplication methods have been shown so far.

*Find the sums below using three different methods for each:*

A)  $98 \times 92$

B)  $19 \times 11$

DELIGHT YOUR CHILD

*Show your child this truly beautiful method of dividing by 9.*

■  $23 \div 9 = \underline{2 \text{ remainder } 5}$

The first figure of 23 is 2, and this is the answer. The remainder is just 2 and 3 added up!

■  $43 \div 9 = \underline{4 \text{ remainder } 7}$

The first figure, 4, is the answer and  $4 + 3 = 7$  is the remainder—could it be easier?

Divide by 9:

- 1) 61    2) 33    3) 44    4) 53    5) 80

Longer numbers are also easy.

■  **$134 \div 9 = 14$  remainder 8**

The answer consists of **1**, **4** and **8**.

**1** is just the first figure of 134,

**4** is the total of the first two figures  $1 + 3 = 4$ ,

and **8** is the total of all three figures  $1 + 3 + 4 = 8$ .

Divide by 9:

- 6) 232    7) 151    8) 303    9) 212    10) 2121

*... otherwise than  
according to her  
[mathematics]  
order nothing can  
exist, and nothing  
takes place in con-  
tradiction to her  
laws . . .*

WILLIAM SPOT-  
TISWOODE

## IMPROVE YOUR MIND

*On a long car journey why not improve your mind by dividing the car numbers by 9, using this remarkably easy method.*

This follows on from the previous page because these sums may have carry figures.

■  $842 \div 9 = 8,2 \text{ remainder } 14 = \underline{92 \text{ remainder } 14}$

Actually a remainder of 9 or more is not usually permitted because we are trying to find how many 9's there are in 842.

Since the remainder, 14, has one more 9 with 5 left over the final answer will be  $\underline{93 \text{ remainder } 5}$

Divide these by 9:

- 1) 771    2) 942    3) 565    4) 555    5) 777  
6) 2382    7) 7070

*When he was twelve George Parker Bidder (1806-78) was asked “if a pendulum clock*

*vibrates the distance of 9.75 inches in a second of time, how many inches will it vibrate in 7 years, 14 days, 2 hours, 1 minute, 56 seconds, each year being 365 days, 5 hours, 48 minutes, 55 seconds?”*

*George gave the answer, 2,165,625,744.75 inches, in less than 1 minute.*

## ON THE TRAIN

### NOT-SO-LONG DIVISION

*On a long train journey? – liven up your trip with this marvellous method for dividing numbers.*

As in the case of ‘long’ multiplication ‘long’ division in this system is not long at all and, in fact, the answer to any division sum can be put down in one line.

■  **$369 \div 72 = \underline{5 \text{ remainder } 9}$**

We use **THE FIRST BY THE FIRST AND THE LAST BY THE LAST.**

Divide the 36 at the beginning of 369 by the first figure of 72:  $36 \div 7 = 5$  remainder 1.

This gives:  $36_19 \div 72 = 5$

The remainder, 1, is placed as shown and makes 19 with the 9 following it.

From this 19 we subtract  $2 \times 5$  (the answer figure multiplied by last figure of 72):

$19 - 10 = 9$ , the remainder.

To sum up, for  $369 \div 72$ :

$36 \div 7 = 5$  remainder 1 gives  $36_19 \div 72 = 5$   
and  $19 - 2 \times 5 = 9$  the remainder,  
so  $36_19 \div 72 = 5 \text{ rem } 9$

■ Similarly  $468 \div 73 = \underline{6 \text{ remainder } 30}$

Because  $46 \div 7 = 6$  remainder 4:  $46_48 \div 73 = 6$ ,  
then  $48 - 3 \times 6 = 30$ , the remainder.

*Try a few yourself:*

- 1)  $456 \div 87$       2)  $468 \div 73$       3)  $369 \div 84$   
4)  $543 \div 76$       5)  $357 \div 61$       6)  $131 \div 43$

Similarly squares, square roots are easily tackled (in one line) by the Vedic method. We can also solve equations and geometrical and trigonometrical problems. The Vedic system covers all areas of mathematics.

It is not possible to show all variations of the methods in this book: all the techniques shown can be extended in various ways (see page 52).

*Number rules the universe.*
