

# 1, 2, 3, LIVE

Initially this was composed as a webpage for [www.vaccinefraud.com](http://www.vaccinefraud.com) but I thought it was important to use it as a synopsis and a contrast for the work presented in **Prion Agenda, Continuum** and all works that preceded them based on my earlier work **1, 2, 3, DEAD**.

People tell me that my work is depressing.

And rightly so.

I have stood at the edge of the Abyss and stared so long that before I even cast myself into it in freefall I could describe and predict it.

Pattern Recognition.

It is a survival tool.

It requires Memory.

That is a survival trait.

In **1, 2, 3, DEAD**, I outlined how the Planetary Military Occupiers use vaccines as weapons. The whiners then bleat like sheep: So, what is the solution?

Like I am some Christ or Moses here to save them or lead them to the unpromised land? Hell, half of the work was done by me just by telling you: Here's the problem...

You see: EVERYTHING is a lie. If that is so, you have to KNOW that it is a lie so that you will not beLIEve that what seems to be some integral part of it might have been a breadcrumb for you to follow out of the maze when it is a clearly smelly line of cheese leading you straight into the guillotine. Hu-Man rats never want to do the work but they sure as hell are feasting on the poison cheese.

I call my unpaid friends who help with research: The Little Red Hens. If you don't know that barnyard story about how no one wanted to help bake bread but everyone wanted a slice then you have a lot of catching up to do. In literature and in life. You do, however, get one grace. Whenever I come across data that I think is essential to the survival of those who are worthy on this planet, I make it public. This is for You, even if we have never met.

In non-lethal cases I hold back on the interesting devilish details as a way of tantalizing people to buy my books, since I was gotten into this nasty habit of eating to survive; and telling the truth sure as Hell doesn't put me on the NYT bestseller list. So, the world owes the Little Red Hens a debt of gratitude for getting us all to the place where we can stare over the barrier of the Maze to see our goal outside of the Lab. One of our Hens, called Rooster had sent the pivotal piece of data that re-ordered everything as I write my books **Prion Agenda** and **Continuum** simultaneously.

<http://www.ncbi.nlm.nih.gov/pmc/articles/PMC1317507/>

Prompted by the discovery that prions become protease-sensitive after exposure to branched polyamine dendrimers in acetic acid (AcOH) (S. Supattapone, H. Wille, L. Uyechi, J. Safar, P. Tremblay, F. C. Szoka, F. E. Cohen, S. B. Prusiner, and M. R. Scott, J. Virol. 75:3453-3461, 2001), we investigated the inactivation of prions by sodium dodecyl sulfate (SDS) in weak acid. As judged by sensitivity to proteolytic digestion, the disease-causing prion protein (PrP<sup>Sc</sup>) was denatured at room temperature by SDS at pH values of =4.5 or =10.

Exposure of Sc237 prions in Syrian hamster brain homogenates to 1% SDS and 0.5% AcOH at room temperature resulted in a reduction of prion titer by a factor of ca. 107; however, all of the bioassay hamsters eventually developed prion disease. When various concentrations of SDS and AcOH were tested, the duration and temperature of exposure acted synergistically to inactivate both hamster Sc237 prions and human sporadic Creutzfeldt-Jakob disease (sCJD) prions. The inactivation of prions in brain homogenates and those bound to stainless steel wires was evaluated by using bioassays in transgenic mice. sCJD prions were more than 100,000 times more resistant to inactivation than Sc237 prions, demonstrating that inactivation procedures validated on rodent prions cannot be extrapolated to inactivation of human prions. Some procedures that significantly reduced prion titers in brain homogenates had a limited effect on prions bound to the surface of stainless steel wires. Using acidic SDS combined with autoclaving for 15 min, human sCJD prions bound to stainless steel wires were eliminated. Our findings form the basis for a noncorrosive system that is suitable for inactivating prions on surgical instruments, as well as on other medical and dental equipment

My response:

Pretty much, if we want to know what is going on in cybernetic nanotechnology / Morgellons we hang out at the NIH sites since the government is the chronicler of that holocaust as well. There is a literal continuum of prions behind all of the major diseases from cardiovascular plaques to cancer (heart disease and cancer elbow each other for the number one position of killers of Americans) along with Alzheimer's, and kiddy Alzheimer's called Autism, Parkinson's, Diabetes, etc. It was of no surprise that the NIH also subtly posts material on the Prion aspect of the Operation Paperclip Medical Manhattan Project as well.

And what a find!

Read the article several times if you don't get it. If you still don't get it, read it with a medical dictionary. I do. People think I'm smart. I am surrounded by at least 5 reference books at a time just to get through this material. I'm just a dumb Farmboy. You can do it too, seeing's your life depends on it. Sodium Dodecyl Sulfate is the Babylonian Name Change for the Same Pig in Different coconut flavored lipstick of Sodium Laurel Sulfate.

What they said: Prions are bastards. In order to get at them you have to crack them open with acetic acid, so that SDS (aka SLS) can snap them off, then you fry their asses with a little proteolytic enzyme like tossing water on the Wicked Witch of the West.

A MIRACLE! you say.

We are saved!

Really?

Internationally known newsletters with more subscribers than I will ever see in a life time all hawk the same thing: You need ACV and CO! Apple Cider Vinegar and Coconut Oil are the supposed saviors of the world. Miraculous stories tell how Dad went from slobbering dementia to tying his own shoes. My response has always been the same: miracles like that often work for a select population or the person really wasn't that ill. Listen: if these were the miracle saviors of the world then me 'n' the Hens would be rulers of this sick rock. Some people can't even tolerate taking ACV. Where does that leave them? Coconut oil is the declared vanquisher of Candida, but what all saturated fats do is increase the hang time of glucose in the blood so if you have a case of systemic

Candida it can actually make you worse by feeding the beast in your own circulation. So where does that leave them?

But worst of all that damns all these internet gurus to Hell as Repeaters (as the friend of David Icke liked to say) is that ACV and CO were only the 1,2 punch of a system designed to knock out the champ. As you dig deeper (and you should) you will find that when amyloid is disaggregated then the seed becomes dispersed. Sure, some immediate symptomology might be relieved as we will see in the patent below, but do you realize what I just said?

You have gone from a scaffold of prions hanging in your lymph system building like the Borg taking over a starship to them all breaking off like metastasized cancer ready to SEED anything they can bind to.

Below is a remarkable patent found by a blogger showing the use of carboxylic acid treatments for prion and other diseases, which is remarkable in itself because in 1976 Albert Szent Gyorgyi the fellow credited with 'discovering' Vitamin C said in Electronic Biology and Cancer that glyoxals (~carboxylates) were the target molecules for treating cancer. Want a kick in the ass? Bend over: Vitamin C in the form of Ascorbic Acid is carboxylate. Vitamin C kills viruses. Viruses provoke prions. We have already established that there is a continuum between prions and all other diseases including cancer, so this should be of no surprise but of significant interest to those trying to kill many demons with just two fists.

<http://patents.justia.com/patent/6652866>

The dog responded favorably to the treatment, and after the first day was noticeably stronger, and could walk on a tile floor. His strength returned over a period of about 3 weeks, at which point the dog was walking without undue effort and could run a short distance. Over a period of about 2 years, treatment was discontinued 5 times for periods ranging from 1-2 weeks, which resulted in dramatic regression. Each time treatment was resumed, the dog's condition improved. Treatment was also varied from a once daily topical application to once every other day to about 2-3 times a week. In the course of treatment, it was discovered that the dog's condition would improve when treated daily, and the dog's condition could be maintained if treated every other day or so. As this dog was relatively old, the owners decided at about 2.5 years after onset of the disease to euthanize the dog. At this point, treatment had been discontinued and the dog could barely walk on a tile floor.

\*\*\*\*\*

In a human subject with a 25 year history of multiple sclerosis, yet another demyelinating disease, a mixture of carboxylic acids prepared as described above was topically applied to the upper back and lower neck of the subject. The quantity applied daily was from about 2-3 tablespoons, with treatment lasting about 45 days. At the time treatment began, the subject had a tremor in one arm, could not button his shirts and could only walk with difficulty with the assistance of a walker and then only a short distance. He could not lift his feet 5 inches or so to the floor of a motorized wheelchair. Within about 24 hours after treatment was begun, the man could button his shirt and the tremor had decreased markedly. His walking had improved, although he still needed to use the walker. The number of times he used the walker and distance he walked also increased, and he was able to lift his feet to the floor of the motorized wheelchair. In addition, family members stated that during treatment his condition and mobility was the best it had been in years. Treatment was terminated after about 45 days, after which the man relapsed to his prior condition of almost being bedridden, and a full-time caregiver was hired.

Such treatment would be continued as long as necessary to either maintain a neurological condition of the affected individual or effect a cure.

I'm sorry...did anyone use the word: cure? Because if they did, I didn't see it. It

seemed that this innovative and applaudable treatment was, just like all Greycoat interventions, a palliative at best. Did the caregivers run out of money or interest resulting in the ultimate demise of their test rats since treatment was consciously discontinued? Treatment. Continuous treatment. NOT A CURE! A CURE would have went something like this: painted goo all over victim; it kicked the prions' ass; all disease symptoms went away permanently.

See? when you Jordanize something not even the highest science that is granted a patent can stand to a simple, powerful thing called Logic and Critical Thinking.

Why?

You might say, that I have simply led you down a fractal path of darkness either back to the beginning of 1, 2, 3, DEAD or more of the same.

And you would be wrong.

Why?

Logic and Critical Thinking.

All that you read was: give the sonofabitch a 1, 2 punch and then walk away. Didn't work did it? Set Point Match & Game to prion because it seems like puppy and granddad didn't make it, did they? That's because I had already explained from the beginning that the carboxylates (ahhh, now you're getting it...ACETIC ACID IS A CARBOXYLIC ACID) followed by detergent (sodium laurel sulfate) from Cuckoo Nut Oil simply released the prionic mess like Thing 1 and Thing 2 in the Cat In The Hat. What was needed was the thing that internet gurus SCARE you away from like used car salesmen trying to steer you away from the good car in order to sell you the lemon.

"Antioxidate" has become a religious fever.

Wanna book preview for free that might save you life? Do you know what antioxidants do? They cause HYPOTHYROIDISM. Want more? Buy my damned books.

What are the enemies of prions?

Oxygen radicals.

No, I didn't say prissy oxygen with happy unicorns and laughing new age hippies with bare feet in Paradiso. I said ass-kicking ozone and superoxides that can tear the hell out of invaders LIKE THEY WERE DESIGNED TO DO, take care of bidnez and then be recycled by super oxide dismutase. Oh, yeah, except that the Planetary Military that knows more physiology than you could possibly grasp on a few millennia in your Fifth Dimension Delusion saw to it that SOD was either disabled or turned into a PRION-FORMING MISFOLDED PROTEIN. Why do you think those internet hacks are screaming at you to anti-oxidate? Your natural body systems were destroyed by vaccines and other bioweapons. You really don't think that an entire species can 'suddenly' become unable to process Oxygen or even Magnesium overnight for some ethereal 'environmental' reason do you? If so, then go to daddy's tool box look for a ball peen hammer and start wailing on your own cranium because you are really too stupid to live.

Anyway...

Ozone, superoxides and things that generate oxygen radicals like IODINE (oh my god! honey...throw away the Iodine that the gurus said that we need because it generates oxygen radicals that they said we don't need!) and Serine Protease proteolytic enzymes.

See what cognitive dissonance will do for you? An internet jackass can tell you to suck down ACV and CO all day long and you will do it. They can destroy your

thyroid with antioxidant and you will pay for it (in more ways than one) next you will go running for the bottle of Iodine when they tell you that 'everybody' is deficient in a substance that every cell of your body needs. Yup. They listen to everything and everyone – but me. Yeah. I'm the fucker that gives you everything you need to know on a single webpage for free because I have nothing to sell, yet if it is only me and twenty other people worth their weight of the entire universe against 7 billion fools we don't have a chance in Hell.

Check out my books. I really do believe we are in Hell, so this message is really a "Fuck You" to the Devil. If christians don't like my message or tone, then: you're going to die anyway so why worry about prions or cancer or diabetes or autism or any of that other stuff that your god never protected you from? So take your basketball and go home it will all get sorted in the hearsay afterlife.

1, 2, 3, LIVE. For the rest of us. I'm not going down without a fight.

Carboxyl substance to attack the prion fold.

Surfactant to disaggregated the prion.

Oxidant/Enzyme to burn it straight to hell.

Does it work?

We don't know yet. It is the year 2016. We just found out. I'm doing the preliminaries to experiment on myself. It takes work and time. What if? What if we start playing with substances based on what seems like a viable remedy to a horrific plague but the creators of the plague wired in booby traps and failsafes? I'm not about to make hasty mistakes. The puppy and granddad died, remember? But I will tell you that the shit that you have been sold so far is balanced on that fine line between ignorant Repeaters and outright Fraud. If you do not kill the beast with a 1, 2, 3 punch, then you have simply released it to wreak havoc. Just like stomach acid being a first line of defense against the outside world also being the very thing that takes the cyst off of a parasite embryo so that it can infect your guts, so too can chymotrypsin take the goo off of the nucleic material inside a virus capsid to make it more infective. Or not. Sometimes. Point/Counterpoint. Fact/Reversal. There is so much that we need command of while sorting through millennia of lies. We can only do it with Science. Never faith, belief or HOPE – the damnation of the world.

Of course, I welcome input on any of this material from anyone of any background. You may email me privately or join my private email list. I also expect people who join my list to contribute data and insight. Freeloaders and curious observers are not welcome. Not when the entire biosphere is in danger of being destroyed or evolved into something that is an abomination by any sane standards from which we may not be able to extract ourselves from the amyloidic prionic glue.

The ancient Chinese martial art parable of Sticky Man comes to mind.
