

“Sky Scan” Searchlights

The pair of “Sky Scan” Searchlights will draw people to your venue and event as they sweep the night sky. These 4,000 watt Xenon arc lights produce beams of light visible for miles, attracting attention throughout the very large footprint of visibility they project.

Although they are wired for 110 volt ac power each searchlight requires a pair of dedicated 20 amp circuits in order to run them at full power. The pair of lights will require almost 80 amps at 110 volts through four outlets. The power source needs to be within a few feet of the searchlights in order to avoid the use of expensive extension cables. Regular duty extension cords will not work. If you plan to power them from your own generators please keep these requirements in mind. Or you may elect to rent the generators from us.

Operating Note

Please note that although these lights project a startlingly bright beam. due to our clean, clear air it can be less dramatic than when there is dust, smoke or fog in the air.

Note: Value if damaged, each Searchlight \$3,000 searchlights may not be operated or exposed to rain and are the responsibility of the renter from time of delivery or pick up. Truck, delivery and set up/operation are additional.

* Searchlights with generators are typically set up in the back of a pick up truck dedicated for the purpose.
