

ELORA SCULPTURE PROJECT – INSTALLATION GUIDELINES

All sculptures must be securely fastened to the permanent base.

The base consists of a 12" diameter concrete pier at ground level and 4 threaded rods of 5/8" (sites 3, 12 & 14 have 1/2" rods). The 4 rods are placed in a square pattern 5.25" center to center.

Your sculpture should have a plate of steel, or other suitable material, to connect to the rods. This can be integral to the sculpture, or a platform or pedestal that the sculpture will be securely attached to.

Holes in your plate should be larger than 5/8"; we recommend 1.0"

The foot print of your sculpture can be any shape or size up to 24" x 48".

Typically, one set of nuts and washers is used below to level your plate and another set to secure it from the top. Hardware is provided for you.

Sites 4,5 & 7 have had risers added due to grading; the size and pattern of the rods is the same.

Small scale sites (9 & 11) have a different configuration.

Artists are encouraged to visit their assigned site to determine the best orientation, etc.

Please inquire before fabrication if you need any further details.

Standard (full size) base. See installation guidelines for dimensions.

Standard base with riser.
