

AlkaViva Athena (JS205) Combo Pack

Also Known as Jupiter Athena

Combo Pack Includes

- 1 ea Alkaviva Sediment Filter, and
- 1 ea .01 M Biostone Filter (MUF)

Biostone Filter

The .01 micron Biostone Filter is a highly effective multi-layered filter with layers of silver activated carbon, fiber and calcium.

Far Infrared Technology (FIR) Breakthrough technology is incorporated in your Jupiter Water Ionizer with the use of "FIR in your filter. This comes in the form of the semi-precious mineral Tourmaline which emits low

frequency energy to soften and wetten water prior to ionization. This process allow for better ionizing and more antioxidant energy in every glass. Biostone one micron (.01M) granulated, silver-impregnated carbon filter.

The .01 Micron standard filter includes layers of coral calcium with magnesium and Tourmaline. The coral calcium is Japanese premium grade and comes from environmentally approved land deposits. The coral calcium not only helps to slightly re-mineralize the water but also naturally sweetens the water and changes volatile fluorine molecules into a benign compound (calcium fluoride).

The tourmaline in this patented, state-of-the-art filter really makes a difference to the ability of the water to carry an ionized charge naturally. As the water passes over the tourmaline crystals the ORP is naturally decreased and the water made more bio-available. What this means is if water passes through your Jupiter - even with the power turned off - the water will come out more ionized!

Sediment Filter

This new Sediment Shield Filter: is only for use in the Jupiter Athena, Model JS205, water Ionizer. It will not fit in the Miracle Fountain. This improved sediment removal filter is 1 Micron; Fiber filled, and designed to remove particles 5 times smaller than the original filter. The sediment filter occupies position #1 in your Athena (inside the left filter housing door).When installing the filter, press the reset button to move the counter to zeros. The carbon filter should be replaced when the digital display reads 9999, after approximately 500 gallons have run through the filter. Each filter includes an adapter that can be used with early Athena Models, prior to August 2009, as a replacement for the filter cup used in those machines. Machines purchase subsequent to that date does not require the adapter.
