

Multiple Trauma

History

- Time and mechanism of injury
- Damage to structure or vehicle
- Location in structure or vehicle
- Others injured or dead
- Speed and details of MVC
- Restraints / protective equipment
- Past medical history
- Medications

Signs and Symptoms

- Pain, swelling
- · Deformity, lesions, bleeding
- Altered mental status or unconscious
- Hypotension or shock
- Arrest

Differential (Life threatening)

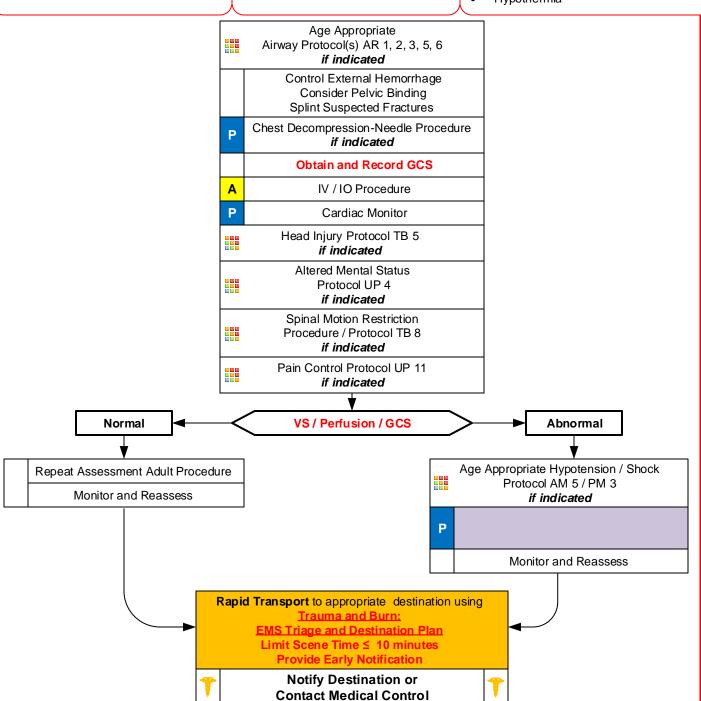

• Chest: Tension pneumothorax

Flail chest

Pericardial tamponade Open chest wound

Hemothorax

- Intra-abdominal bleeding
- Pelvis / Femur fracture
- Spine fracture / Cord injury
- Head injury (see Head Trauma)
- Extremity fracture / Dislocation
- HEENT (Airway obstruction)
- Hypothermia

Multiple Trauma

Pearls

- Recommended Exam: Mental Status, Skin, HEENT, Heart, Lung, Abdomen, Extremities, Back, Neuro
- Items in Red Text are key performance measures used in the EMS Acute Trauma Care Toolkit
- Transport Destination is chosen based on the EMS System Trauma Plan with EMS pre-arrival notification.
- Scene times should not be delayed for procedures. These should be performed en route when possible.

 Rapid transport of the unstable trauma patient to the appropriate facility is the goal.
- Control external hemorrhage and prevent hypothermia by keeping patient warm.
- Consider Chest Decompression with signs of shock and injury to torso and evidence of tension pneumothorax.
- Trauma Triad of Death:

Metabolic acidosis / Coagulopathy / Hypothermia

Appropriate resuscitation measures and keeping patient warm regardless of ambient temperature helps to mitigate metabolic acidosis, coagulopathy, and hypothermia.

- Bag valve mask is an acceptable method of managing the airway if pulse oximetry can be maintained ≥ 90%
- Tranexamic Acid (TXA):

Agencies utilizing TXA must have approval from your T-RAC.

• Trauma in Pregnancy:

Providing optimal care for the mother = optimal care for the fetus. After 20 weeks gestation (fundus at or above umbilicus) transport patient on left side with $10 - 20^{\circ}$ of elevation.

Pediatric Trauma:

Age specific blood pressure 0-28 days > 60 mmHg, 1 month - 1 year > 70 mmHg, 1-10 years > $70+(2 \times age)$ mmHg and 11 years and older > 90 mmHg.

Geriatric Trauma:

Evaluate with a high index of suspicion.

Often occult injuries are more difficult to recognize and patients can decompensate unexpectedly with little warning.

Risk of death with trauma increases after age 55.

SBP < 110 may represent shock / poor perfusion in patients over age 65.

Low impact mechanisms, such as ground level falls might result in severe injury especially in age over 65.

- See Regional Trauma Guidelines when declaring Trauma Activation.
- Severe bleeding from an extremity not rapidly controlled with direct pressure may necessitate the application of a tourniquet.
- Maintain high-index of suspicion for domestic violence or abuse, pediatric non-accidental trauma, or geriatric abuse.
