

Infrared

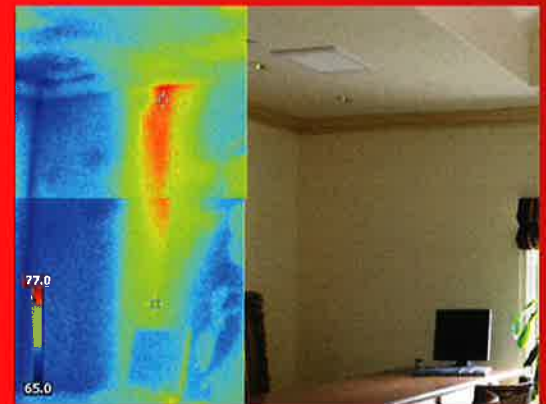

Inspections

Thermography measures surface temperatures by using infrared still cameras. These tools see light that is in the heat spectrum. Images on the digital photos record the temperature variations of the building's envelope, ranging from white for warm regions to black for cooler areas. The resulting images help the inspector determine what problems. They also serve as a quality control tool, to ensure that insulation has been installed correctly. Your property is an investment, so it is important that it receives quality repairs and service.

When you call Atlas, we make sure you have a clear understanding and multiple choices that lead to the best possible solution so you can have peace of mind.

The Atlas Quality Team is professional and equipped to protect your interests. We are certified to perform the inspection that's right for you. Each project we complete results from our management team's expertise of more than 40 years.
