

DEOXYARBUTIN

Deoxyarbutin is a synthetically modified derivative of arbutin possessing enhanced skin lightening properties. This highly effective tyrosinase inhibitor is reported to have 350 times the skin lightening activity of arbutin, 150 times that of kojic acid, and 10 times more than hydroquinone.

Skin care studies show that Deoxyarbutin is longer-lasting, more stable, less cytotoxic, less irritating and better absorbed than other well-known lighteners. In addition, Deoxyarbutin exhibits excellent antioxidant properties to protect cells from harmful radicals.
