

Everlasting Process Valves in Catalyst Handling

For nearly 30 years Everlasting Valve Company has been supplying their self-lapping rotating disc valves to many refineries and refinery related companies around the world for handling fresh catalyst and catalyst slurries. From FCC to CCR to catalyst and additive skids, the unique design of the rotating discs combined with the open body design produces a valve that gives tight sealing over the life of the valve.

Everlasting Valve's flat discs rotate which polishes scratches from the sealing surfaces on the disc and seat, and spread wear evenly providing tight shutoff and longer service life. Unlike other types of valves, there are no pockets or gaps into which fines can accumulate. As a result, the open body design of the Everlasting valve resists packing and is self-cleaning. The internal design is more forgiving on the catalyst resulting in less catalyst damage and fines creation. It is for these reasons that Everlasting valves are the preferred valves for catalyst slurries and fresh catalyst addition in refineries around the world.

The following are just some of our customers using Everlasting Process Valves for catalyst slurries and fresh catalyst handling:

BP Chemicals	USA
BP Husky Refining	USA
Big West Oil	USA
Chalmette Refining	USA
Chennai Refinery	India
ConocoPhillips	USA
ENI S.P.A.	Italy
ExxonMobil	USA
Hindustan Petroleum	India
Imperial Oil	Canada
Indian Oil Co.	India
John Matthey	USA
Malaysia Refining	Malaysia
Oryx GTL	Qatar
Shell	Canada

Valve Manufacturers Since 1906

- Boiler Blow-Off Valves
- Bulk Material Valves
- Process Valves
