

GASTON RADIOLOGY OFFERING VARICOSE VEIN SOLUTIONS

Gaston Radiology has been serving Gaston County for 58 years, making it one of the oldest and largest medical practices in the region. The eighteen member group has recruited the very best sub specialty trained radiologists in nuclear medicine, musculoskeletal, breast and body imaging, neuroradiology and interventional radiology who have raised the bar on local expertise to compete at a world class level.

CaroMont Imaging and Gaston Radiology offer the latest technology available at four imaging centers located at Summit Place, the Diagnostic Center, Gaston Memorial, and Belmont. They also staff the new Women's Imaging Center at Summit Place.

Venous Closure is one of the many advanced treatment options offered to patients by our interventional radiologists that help referring physicians and their patients choose a much less invasive and much less painful procedure to treat varicose veins.

Forty million adults, both men and women, are affected by unsightly varicose veins. A leading cause of this medical condition is venous reflux disease caused by incompetent or "leaky" valves in the greater saphenous vein running from groin to ankle in each leg. Symptoms include varicose veins, leg pain, fatigue, swelling, and skin ulceration. Traditionally physicians who wanted to address venous reflux disease often elected to remove or "strip" the saphenous vein which resulted in 2-4 weeks post surgery convalescence. Venous closure is a minimally invasive treatment alternative in which the patient can resume their regular activities in a single day.

Gaston Radiology and CaroMont Imaging Services want to communicate the benefits of this advanced technology and as a result we are offering free venous closure consultations to all patients who may be suffering from venous insufficiency.

Simply call us at 704-671-7765 for Your FREE Consultation.

Gaston Radiology and CaroMont Imaging Services are determined to offer our community the best imaging technology and expertise available anywhere. We also offer Digital Mammography to every patient which helps in the detection of 20% more breast cancers in certain groups of women. Our radiologists perform stereotactic breast biopsies and breast MR to complement our digital mammography in certain cases. We provide 64 slice CT technology for a faster more comfortable imaging experience along with cardiac calcium scoring for early detection of heart disease. Our open MRI meets the needs of our claustrophobic patients. We offer new procedures such as vertebroplasty, kyphoplasty, and uterine fibroid embolization which provides an alternative to removing the uterus in qualified cases. The PET-CT allows our physicians to better diagnose and stage some cancers. It is our goal to ensure that Gaston County receives the very best care available anywhere.
