Consulting Doctor: Matt Boothe, DVM

Client Details

Name Petras, Jessica
Address P.O. 782
Prince George, Virginia,
23875

Patient Details

Name	Liberty Bengals	Age	10 months
	Ominous Onyx	Sex	Female
Species	Feline	Referral	No Primary
Breed	Bengal		Veterinarian - No Primary Veterinarian

Client Summary

Cardiac Evaluation Report

Exam Date: 05-21-2022

Diagnosis

- Normal cardiac structure and function
- No signs of cardiomyopathy

Please Note

Nutrition and Activity: Normal.

At Home Monitoring: There is currently a very low risk for clinical signs of heart disease. However, as cardiomyopathy can develop at any age, please monitor for signs of respiratory difficulty, exercise intolerance, anorexia, weakness, lethargy, etc. If you note any of these symptoms, please have Liberty Bengals Ominous Onyx evaluated by your veterinarian.

Breeding Recommendations: No specific precautions noted for continuation in a breeding program.

Reevaluation

- Continue routine care as recommended by your primary care veterinarian.
- Recommend a recheck echocardiogram if an abnormal cardiac exam is noted, clinical signs of cardiac disease develop, an abnormal NTproBNP (cardiac stress hormone blood test) is noted, or at least every 2 years for at-risk breeds, especially those that have been used in or are actively being used in a breeding program.

Visit Summary

History: Presented for evaluation in HCM clinic/pre-breeding screening. Apparently healthy.

Focused Physical Exam Findings: HR 180, soft grade I-II/VI left parasternal systolic murmur, no arrhythmia, click, or gallop; strong/synchronous/symmetrical femoral pulses; MM pink/moist, CRT <2 sec; eupneic, normal BV sounds throughout all fields.

Liberty Bengals Ominous Onyx

Pg: 1 / 2

Screening Echocardiographic Findings

Normal left atrium; normal mitral valve with no regurgitation; normal left ventricular end diastolic and systolic dimensions; normal septal and left ventricular wall thickness; normal indices of systolic function; normal aortic valve and ascending aorta; normal left ventricular outflow tract on CFD; normal right atrium; normal tricuspid valve with trace regurgitation; normal right ventricle; normal pulmonic valve and pulmonary artery; normal right ventricular outflow tract velocity and profile.

Comments

Fortunately, there are no signs of cardiomyopathy today and thus no concern for use in a breeding program. There is a very soft murmur today which is innocent or benign given the absence of cardiac disease. We recommend twice yearly physical examinations for all cats of breeds that are at risk for cardiomyopathy. Signs of cardiomyopathy can develop at any age. Thank you for visiting us at this clinic setting today.

Sincerely,
Matt Boothe, DVM, DACVIM (Cardiology)
