

# Bloxygen - Finish Preserver Spray, Seal, and Store

## Preserves oxygen or moisture-sensitive products:

- . oil-based paint
- . varnish
- . polyurethanes
- . catalysts
- . photo chemicals
- . tung oil
- . wood fillers
- . urethanes
- . stains
- . gunpowder
- . marine coatings
- . printing chemicals
- . lab chemicals
- . sign paints
- . autobody chemicals
- . refinishing products
- . some glues
- . epoxy resin
- . wine, hops, seeds
- . cooking oils

## Benefits of Bloxygen:

- Use all your finish, not just the first half
- Prevent changes in product chemistry during storage
- Save time by making finishing projects easier and cleaner
- Store your leftovers safely, in the original labeled container
- Reduce your hazardous waste / product loss
- Avoid paying a premium for small volumes of finish
- Improve the quality of the final application
- Eliminate spray gun clogs and jams

FINISH PRESERVER

**It's simple, just Spray, Seal, and Store.** Use ultra pure and natural Argon. It is nature's preservative and will eliminate damage from oxygen or moisture. Use every drop of your expensive finishes and eliminate waste, prevent spray gun clogs, and simplify finishing. Use our patented inert gas technology and FINISH CLEAN.

**Is Bloxygen Expensive?** No. Each can of Bloxygen lasts for 75 uses in quarts. Bloxygen only costs about 16 cents per use.

**What about marbles?** Some folks try to eliminate the air space in their container by throwing marbles or rocks in the liquid. In addition to contaminating their product, they find that cleaning the marbles results in lots of wasted time and product.

**What about exhaling into the container?** As paramedics know, the air we exhale is NOT oxygen free (in fact, it will support life). We inhale 21% oxygen and exhale about 15% oxygen.

**What about tipping the container over?** Storing your leftovers upside down will only guarantee that the skin will form on the "bottom" of the liquid. Your finish will still be ruined.

**Will it work?** Bloxygen was tested successfully by all major paint manufacturers and even NASA. Solid science led to recommendations from all the major paint manufacturers and excellent media reviews.

**What can we use it on?** Argon is used in many applications, from packaging salad and potato chips to welding. Basically, Bloxygen will prevent loss in any oxygen or moisture sensitive product:

oil based paint, marine coatings, varnish, polyurethane, sign paint, printing chemicals, catalysts, photo chemicals, tung oil, wood fillers, urethanes, stain, gunpowder, epoxy resin, glue, auto body chemicals, fuel additives. Since Bloxygen is food safe, you can also use it on wine, cooking oils, hops, seeds, coffee beans, and even guacamole!

**What if I have a problem?** There are only three problems we've ever seen:

- Not Enough Gas Used: The entire storage container must be purged of oxygen. You cannot use too much Bloxygen.
- Slow Lid Seal or a bad seal: Once the container is purged of oxygen, the lid must be immediately sealed into place. Make sure the lid is spotless and dent free to create an airtight seal.
- Bad Finish: Once oil-based finishes absorb oxygen and skin over or gel, they will continue to have problems during storage. These finishes will never be the same. Start with new finish and use Bloxygen each and every time it's stored.
