

A.C.E.

Assess, Characterize, Enlighten, Empower, and Evolve

Our ability to A.C.E.- Assess past performance and the Characterization current perceptions/paradigms and Enlighten us as to those future options/opportunities that Empowers our ability to influence and effect the environment that afford the means to transform it through an Evolutionary process. For today's Analytical systems autonomously endeavor to Inform (AI) and put things into context through prescriptive and predictive modeling in an effort to illustrate our current circumstances through contextual correlation. From this temporal measure, we can determine adaptive correlations as we endeavor to better understand causality and its relationship with consequence through machine learning (ML). It is through AI that past/present circumstances can be understood, enabling the identification of causality and its relative consequences, from which wisdom can be derived.

Through temporal assessments and the resulting adaptive correlations, will we be afforded the means to leverage ML in a way that reveals trends, leveraging facts gathered through the maturation process of collecting data and correlating them into information that produces contextual knowledge? It is through these efforts that we can offer a myriad of possibilities and identify potential future options that reveal ways to take actions that influence the environment to achieve the desired result. Thus, through the Art of the Possible and the Science of the Probable, we can capitalize on the potential in our current state to influence the environment in ways that actualize opportunities in our future state.
