## HIGHLAND PARK SUBDIVISION 2024 WATER QUALITY REPORT

Georgia Water System ID: GA0050007

Name of Water System Contact:

**Contact Phone Number:** 

Curtis C. Hall, Owner / Barbara K. Hall, Operator

912-632-8919

### Summary of Water Quality Information

**The Highland Park Subdivision** drinking water system is owned by Curtis C. Hall and operated by Barbara K. Hall. The facility office is located at 832 West 12<sup>th</sup> Street in Alma, Georgia. If there are any comments or inquiries, please feel free to contact the owner or operator at the number listed above.

Included in this report is information about where your water comes from, what it contains, and how it compares to standards set by regulatory agencies. The **Highland Park Subdivision** water system is committed to providing your community with clean, safe, and reliable drinking water for everyone. For more information about your water or this report please contact the owner or operator.

Your water comes from one (1) community *groundwater* well, identified as well 101. This well, located 360 feet southeast of the US Highway 1/23 and Ocelot Road intersection in **Highland Park Subdivision**, derives water from *Coastal Plain aquifer* to provide ample volumes of water for your community. Necessary treatment, such as the removal of contaminants and/or addition of disinfectants, are performed at the well site.

A **Source Water Assessment Plan (SWAP)** has been completed for this facility by the Georgia Department of Natural Resources Environmental Protection Division (GADNR/EPD). This report identifies any types of pollution to which your water supply could be vulnerable and includes information regarding potential sources of contamination in your watershed. This well is considered to be in the high susceptibility range for pollution. Utility poles and maintenance equipment are cited as potential pollution sources within the 15-foot control zone of the well. Pollution sources found within the 437-foot management zone of the well include electrical transformers, utility corridor, domestic septic systems, domestic wells, stormwater run-off/infiltration, US Highway 1/23, agricultural fields, access and secondary roads. **The full SWAP is available upon request**.

The **Highland Park Subdivision** water system is tested for more than eighty (80) drinking water parameters on a periodic basis determined by the GADNR/EPD Drinking Water Program and/or the United States Environmental Protection Agency. Sample/testing schedules are based on initial contaminant level assessments and can be changed when necessary. Waivers may also be issued for the analysis of certain compounds if analytical data shows that the distributed drinking water in this area is not vulnerable to contamination from these chemicals.

Generally, samples are collected from the **Highland Park Subdivision** water system for the analyses of nitrate-nitrites annually; inorganic contaminants (IOCs), volatile organic contaminants (VOCs), synthetic organic contaminants (SOCs), lead, and copper once in a three (3) year cycle; and radionuclides every nine (9) years. The **Highland Park Subdivision** also performs regular monitoring of the facility, including the collection of monthly samples for the analyses of bacteriological content.

During 2024, the **Highland Park Subdivision** water system was sampled and analyzed for bacteriological content and nitratenitrites. All detected contaminants are delineated in the accompanying chart and any constituents not listed in the chart had results less than the detection limits and/or maximum contaminant levels. **We are pleased to inform you that all tested contaminants** were below the maximum contaminant levels during 2024.

For the most recent lead and copper testing cycle, samples were taken from five (5) representative locations throughout the system. While **NO** sampled site exceeded the lead and copper *Action Level*, measurable quantities of copper were detected in at least one sample. Lead and copper are metals naturally found throughout the environment in soil and water. Customers should know that these metals can also be found in lead, copper, or brass household plumbing pipes and fixtures. Even consumer products such as paints, pottery, and pewter can contain lead and/or copper. Corrosion or deterioration of lead or copper-based materials, as well as erosion of natural deposits can release these metals into the drinking water. To access all individual lead tap sample results for **Highland Park Subdivision**, visit <a href="https://www.gadrinkingwater.net">www.gadrinkingwater.net</a>.

The Service Line Inventory (SLI) is a requirement under the Lead and Copper Rule Revisions (LCRR) to help water systems identify and replace lead service lines. It mandates that all public water systems develop and maintain an inventory of service line materials to assess the presence of lead and protect public health. The inventory will support proactive lead reduction efforts and ensure compliance with regulatory requirements to minimize lead exposure in drinking water. **The Highland Park Subdivision has submitted the required lead service line inventory. To view the complete SLI report, please visit the following website:** https://ga-epd.120water-ptd.com/.

Lead can cause serious health effects in people of all ages, especially pregnant people, infants (both formula-fed and breastfed), and young children. Lead in drinking water is primarily from materials and parts used in service lines and in home plumbing, The **Highland Park Subdivision** is responsible for providing high quality drinking water and removing lead pipes but cannot control the variety of materials used in the plumbing in your home. Because lead levels may vary over time, lead exposure is possible even when your tap sampling results do not detect lead at one point in time.

You can help protect yourself and your family by identifying and removing lead materials within your home plumbing and taking steps to reduce your family's risk. Using a filter, certified by an American National Standards Institute accredited certifier to reduce lead, is effective in reducing lead exposures. Follow the instructions provided with the filter to ensure the filter is used properly. Use only cold water for drinking, cooking, and making baby formula. Boiling water does not remove lead from water. Before using tap water for drinking, cooking, or making baby formula, flush your pipes for several minutes. You can do this by running your tap, taking a shower, doing laundry or a load of dishes. If you have a lead service line or galvanized requiring replacement service line, you may need to flush your pipes for a longer period. If you are concerned about lead in your water and wish to have your water tested, contact the **Highland Park Subdivision**. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available at https://www.epa.gov/safewater/lead.

#### To minimize exposure to lead and/or copper, the following measures may be taken:

- Flushing tap for 30 seconds to 2 minutes before using water for drinking or cooking.
- Use cold water for drinking or cooking.
- Do not cook with or consume water from the hot water faucet.
- Do not use hot water for making baby formula.
- Use only "lead-free" solder, fluxes and materials in new household plumbing and repairs.

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the **EPA Safe Drinking Water Hotline** (1-800-426-4791).

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. USEPA/Centers for Disease Control (CDC) guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the Safe Drinking Water Hotline (1-800-426-4791).

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity.

#### Contaminants that <u>may</u> be present in source water include the following:

- *Microbial contaminants*, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- *Inorganic contaminants* such as salts and metals, which can be naturally occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.
- *Pesticides and herbicides*, which may come from a variety of sources such as agriculture, urban storm water runoff, and residential uses.
- *Organic chemical contaminants*, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban storm water runoff, agricultural application, and septic systems.
- Radioactive contaminants, which can be naturally occurring or the result of oil and gas production and mining activities.

In order to ensure that tap water is safe to drink, EPA prescribes regulations which limit the amount of certain contaminants in water provided by public water systems. Food and Drug Administration regulations establish limits for contaminants in bottled water which must provide the same protection for public health.

The **Highland Park Subdivision** water system strives to maintain the highest standards of performance and quality possible. In order to maintain a safe and dependable water supply, improvements that benefit the community must be made. Please help keep these costs as low as possible by utilizing good water conservation practices.

#### **DEFINITION OF TERMS AND ABBREVIATIONS USED IN THIS REPORT:**

**Treatment Technique (TT):** "A required process intended to reduce the level of a contaminant in drinking water."

<u>TTHMs (Total Trihalomethanes):</u> One or more of the organic compounds Chloroform, Bromodichloromethane, Chlorodibromomethane, and/or Bromoform.

<u>HAA5s (Haloacetic Acids)</u>: One or more of the organic compounds Monochloroacetic Acid, Dichloroacetic Acid, Trichloroacetic Acid, Monobromoacetic Acid, and Dibromoacetic Acid.

# Highland Park Subdivision 2024 Water Quality Data

WSID: GA0050007

The table below lists all the drinking water contaminants that have been detected in your drinking water. The presence of these contaminants in the water does not necessarily indicate that the water poses a health risk. The data presented in this table is from testing done during the year noted. The Federal Environmental Protection Agency (EPA) and the Georgia Department of Natural Resources Environmental Protection Division (EPD) require monitoring for certain contaminants less than once per year because the concentrations of these contaminants are not expected to vary significantly from year to year. Parameters, values, and/or sources may vary.

DETECTED INORGANIC CONTAMINANTS TABLE									
		MCL		Highland Park Subdivision	Range of	Sample	Violation		
Parameter	Units	[SMCL]	MCLG	Water System Results	Detections	Date	No/Yes	Typical Source of Contaminant	
Fluoride	ppm	4	4	0.34	0.34 to 0.34	2023	No	Erosion of natural deposits; water additive to promote strong teeth; discharge from fertilizer and	
								aluminum factories	

LEAD AND COPPER MONITORING RESULTS									
		Action		Highland Park Subdivision	Range of	Sample	Violation		
Parameter	Units	Level	MCLG	90th Percentile	Detections	Date	No/Yes	Typical Source of Contaminant	
Lead	ppb	15	0	ND	N/A	2022	No	Corrosion of household plumbing	
Copper	ppm	1.3	1.3	0.048	0.012 to 0.069	2022	No	Corrosion of household plumbing	

OTHER DETECTED UNREGULATED CONTAMINANTS TABLE									
Highland Park Subdivision Range of Sample Violation									
Parameter	Units	MCL	MCLG	Water System Results	Detections	Date	No/Yes	Typical Source of Contaminant	
Sodium	ppm	**	**	10.0	10.0 to 10.0	2023	No	Erosion of natural deposits	

MICROBIOLOGICAL MONITORING RESULTS									
				Highland Park Subdivision	PositiveSample	Sample	Violation		
Parameter	Units	MCL	MCLG	Number of Positive Samples	Date (Month/Year)	Year	No/Yes	Typical Source of Contaminant	
Total Coliform	Present/	1*	0	1	August	2024	No	Naturally present in the environment	
E. coli	Absent	0	0	0	N/A	2024	No	Human and animal fecal waste	

- \*Total Coliform Rule MCL= 1 positive sample for systems that collect <40 samples a month \*\* No established MCL, SMCL or MCLG •N/A: Not applicable to this contaminant.
- •ppb (ug/L): parts per billion or micrograms per liter •ppm (mg/L): parts per million or milligrams per liter •pCi/l: picocuries per liter, a measurement of radiation
- •ND (Not Detected): By regulation, this substance or group of substances was tested for in our finished tap water; however, none was detected at the testing limit.
- •Action Level (AL): "The concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow."
- •Maximum Contaminant Level (MCL): "The highest level of a contaminant that is allowed in drinking water. MCL's are set as close to the MCLG as feasible using the best available treatment technology."
- •Maximum Contaminant Level Goal (MCLG): "The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLG's allow for a margin of safety."
- •Secondary Maximum Contaminant Level (SMCL): reasonable goals for drinking water quality. Exceeding SMCL's may adversely affect odor or appearance, but there is no known risk to human health.
- •Maximum Residual Disinfectant Level (MRDL): "The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbiological contaminants."
- •Maximum Residual Disinfectant Level Goal (MRDLG): "The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.
