

How & Why Ultraviolet Disinfection Works

Ultraviolet energy can be separated into UV-A, UV-B, and UV-C

Ultraviolet Germicidal Irradiation (UVGI) uses UV-C, the component of ultraviolet energy that breaks through the outer membrane of microbes like yeast, mold, bacteria, viruses, and algae. When the UV-C energy reaches the DNA of the microbe, modifications cause the microbe to lose its ability to reproduce. UVGI lamps provide a powerful and concentrated dose of UV-C energy that will sanitize the air, surfaces, and water. Destroying pathogens that come into contact with the UV rays. The Centers for Disease Control Confirms the germicidal effect of UV-C lamps.
