Most of the candidates try to solve data sufficiency questions by guess work. As every question carries same marks, questions in this part also deserve some time. Instead of guess work use a simple strategy as give below and avoid guessing the answer.

TIPS:

- Never try to reach final answer as it is not asked. You need to find whether the information provided is enough to solve the given problem or not.
- Never make any assumptions or things granted. Use only universal rules
- Try to solve questions by using above strategies
- Solve question step by step. First try to find answer using first statement then second and finally with both. Then mark the answer
- Even if you find answer with only one statement, then try to find answer with remaining statement as sometimes there is an option that answer can be find with both statements separately.
- Move on quickly and mark answer can't be found in case you are unable to reach any conclusion with information provided

Directions :

Marks A as answer if statement I alone is sufficient to answer the question

Marks B as answer if statement II alone is sufficient to answer the question

Marks C as answer if statement I and II together are sufficient to answer the question but neither statement alone is sufficient to answer the question

Question 1. How many people are there in the plain ?

Statement I : 25% passengers are women and 35% are children.

Statement II : There are 24 men in the plain

Answer

From Statement I we can conclude that there are 40% men in the plain but we can't find the exact number of passengers

From Statement two : Number of men passengers = 24

By combining both the statements we get, total number of passengers = $24 * 100/40 =$ (you don't need to calculate the answer)

Hence answer is C

Question 2. What is the difference between monthly income of Ram and Chaaru

Statement I : Ram earns Rs 6000 less than Shaam

Statement II : Chaaru earns Rs 6000 more than Shaam.

Answer : In this question we don't need to in depth. Simply there is difference of Rs 12000

Question 3. Is x divisible by 28 ?

Statement I : x is divisible by 20

Statement II : x is divisible by 84

Answer. Using statement I - x is divisible by 4 and 5

Using statement II - x is divisible by 3,4, and 7.

By using both statements we can conclude that x is divisible by 28 ($4*7$), hence answer is C.

Question 4. P,Q,R,S and T are five friends. Their mean age is 18. What is the age of R ?

Statement I : P's age is 18

Statement II : Q's age is 2 years less than T and T's age is 6 years less than S.

Statement III : R's age is 6 years more than B's age and 4 years more than T's age.

Answer : $P+Q+R+S+T = 90$

From Statement I : $Q+R+S+T = 72$

From Statement II : $Q = T - 2$ and $T=S - 6$

So $S = T + 6$

Statement III : $R = Q + 6$ and $R = T + 4$

Age of every friend can be defined in terms of T's age by using all three statements. So we can reach the answer using all three statements. Hence answer is C.

Good luck! CHEERS!!
