BATT-RECON saves client's money and increases our service revenues!

There is an increasing use of electric golf cars in the United Kingdom, however, this resulted in a large un-wanted fleet of pre-owned golf carts with un-serviceable batteries.

Our Company is always looking for new "State of the Art" products and services to offer our clients. For years we extensively researched battery de-sulphation techniques, but were unable to find a reliable, fast and scientifically based process that actually worked. We tried many battery liquid additives and electrical "buzz boxes," but were unable to see any measurable results.

Whilst browsing the internet we located the Batt-Recon process and decided to investigate further. I made an inquiry to the Los Angeles based company and had an immediate phone call back to the UK the same day. The guys at Batt-Recon answered all our questions and more. We were impressed with their battery knowledge and the fact that they developed their products based on scientifically verifiable data. Having contacted existing BATT-RECON users, we were consistently amazed at their stories that a complete golf cart battery pack could be de-sulfated in about 30 minutes! When combined with an overnight charge, a measurable and significant increase of battery capacity was achieved, many times from 50 to 85%. All of this was accomplished without removing the electrolyte or using additives!

Custom Golf Cars LTD, purchased a machine to test the UK market for de-sulfating golf cars, forklift, marine, telecommunication and automotive batteries. We purchased a BATT-RECON Model 4810 AGC system along with the Cadex CA 12 battery analyzer, to scientifically verify the results. We determined the process of testing, de-sulphating, and re-testing an entire golf car battery pack can be carried out using BATT-RECON and CADEX, in less than 40 minutes.

We are pleased that BATT-RECON has become a huge success and is now a major part of our business model. BATT-RECON creates a large growth potential for our company and we are developing a vast network of BATT-RECON Sulphation Elimination service centers in the UK.

SAVE A BATTERY - SAVE MONEY - SAVE THE PLANET!
