**Changing Brushes:** Lamb vacuum motors are designed to be able to change carbon Brushes to extend the overall operating life unit. Brushes must be changed before there is any damage to the commutator. Normally, if a motor runs till it stops because the brushes are worn out, the commutator will be damaged and it will not be feasible to change the brushes. Only the original brush or a replacement recommended by Lamb should be used. After changing the brushes, the commutator should be stoned to clean off the old carbon. After cleaning the commutator, the motor should then be run in at reduced voltage to seat the brushes. This is essential to ensure that there is good commutation after changing the brushes. If a variable voltage source is not available, a simple way to provide reduced voltage during the run-in period is to connect two like vacuum motors in electrical series. Connect one power lead from each motor together and then connect the remaining leads (one from each motor) to line. Connected in this manner, each motor will draw approximately 60 volts (on 120 volt power). Run the repaired motor in this manner for about 25 minutes. This will seat the brushes to the commutator and after running in, the motor can be operated at the nominally rated voltage.

| Part #    | Description  | Sale/ea  |
|-----------|--|----------|
| 122585-00 | 2 stg peripheral disc. Metal (comparable to 116336-01-5.7"-120V) | \$42.50  |
| 116515-13 | 5.7" - 24V - 3 Stg w/horn  | \$97.50  |
| 114787    | 7.5"-120V-3 Stg Perip Mtr.                                       | \$325.00 |
| 118111-53 | PN Motor - Castex / Noble w/ grooved shaft                       | \$22.50  |
