

The Many Ways We Protect Your Business Valuation Data

We provide clients with accurate and efficient business valuations needed for sound planning decisions. The technology we use harnesses the power of big data to assess the value of a business on many dimensions. Throughout the process, we ensure clients' private financial information remains confidential.

Non-Sensitive Data

Non-Transactional

Non-Sensitive Data

Secured Data

- We do not gather or store sensitive personal data on businesses we value.
- We do not and will not ask for or gather Social Security number, Tax ID Numbers or any website credentials.
- We do not collect or store account identifiers of our valuation process.
- We also do not share the information you provide to other advisory services.
- Unlike many other financial services sites that require entry of financial information our tool is **not** transactional.
- Because we do not move or transfer funds on our system, we are not an attractive target for cybercriminals.
- Our system uses 256-bit Secure Socket Layer encryption. This is currently the highest level of encryption available and when applied scrambles your data so that only authorized users can read it.

The industry standard encryption level for financial services sites is 128-bit.

... We use 256-bit encryption.

- Our business valuation tool is hosted by Rackspace, the hosting provider for over 60% of the Fortune 100 companies. Their systems are certified by Microsoft and they respond to intrusion and threat detections 24 hours a day, 7 days a week, and 365 days a year.

Let us help you better understand the value of your business.
