

Special Hazards and Capabilities

These are services A-EHS can provide, related to specialized environmental health and safety programs; unique capabilities that go beyond the norm for most consultants.

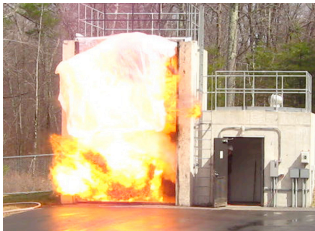

Ventilation System Efficiency Assessment

This is not testing the laboratory or process ventilation for the numerical flow rate. This is an evaluation of the system to ensure just the right amount of air is being extracted. As it costs money to condition (heat & cool) the incoming air, you want the most efficient system, not one with the most air throughput.

OSHA PSM & Seveso Directive Analysis

A-EHS's experts can review your operations relative to OSHA's Processes Safety Management (PSM) program, or the New Jersey Toxic Catastrophe Prevention Act (TCPA) or the EU's Seveso Directive, as appropriate, and advise you of deficiencies and any corrective actions that may be necessary.

Explosive Dusts Evaluation

A-EHS can perform an expert review of the explosive potential of organic and inorganic dusts that you process. By employing our custom iOS software screening tool *EXPOSÉ™* (**EX**plosive **P**otential **S**creening **E**valuation), reviews can be accomplished rapidly and accurately.

Exposure Assessment Development

Many chemicals and pharmaceuticals have no published exposure limit from OSHA or other agencies. It is important to know what a safe exposure is for these materials, and how to evaluate the exposures. A-EHS, in partnership with a 3rd-party laboratory, can develop validated methods so you and customers can assess employee exposures.

Let us know how we can help you.
