

Gap Analysis Audit

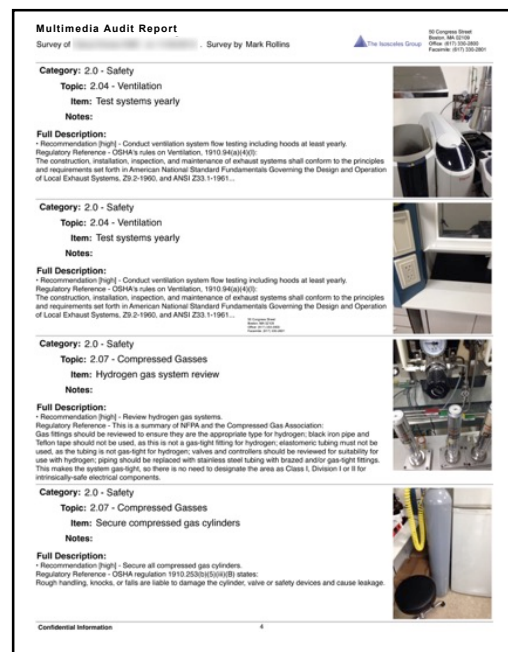

Most businesses have good overall programs for workers compensation, safety, environmental compliance, loss prevention, and sustainability. But any program can be improved, with good becoming great, and great becoming excellent. One might ask, "how do we get there?"

A suggested option is a Gap Analysis Audit. This is where highly-experienced professionals review existing programs and procedures, as these relate to various regulations and practices applicable to your operations. These are compared to regulatory requirements (the minimum standard), recommended practices from groups like NFPA, and best management practice as followed by industry and insurance companies.

A complete multi-media site Gap Analysis Audit can be accomplished by A-EHS staff, using our custom mobile software auditing tool *SHARPER* (Safety & Health Audit; Responsibility, Property & Environment Reporter).

SHARPER allows us to rapidly identify and summarize those gaps or deficiencies in your existing programs that need additional emphasis or attention. The report will include photographs as appropriate, as well as a summary and rationale behind observations, as well as suggested actions.

It also will not take as long as you may think. We realize your time is valuable, and have engineered this audit to be as streamlined as possible. For example, a "pre-audit survey" allows us to focus only on pertinent items, and you can prepare requested documents ahead of time. With these tactics and the use of SHARPER, an audit from A-EHS can be accomplished in about *25% less time* than what you may be used to.
