

Termites

Having termites can be quite disturbing, because when you finally find the damage, it can be extensive. Having a termite inspection by a termite professional is the first step to solving your problem. A professional will determine the type of invader and what the perfect treatment for your home should be. With rest assured termite protection, termites will be a thing of the past and you can have worry free protection to guard and defend your greatest asset, your home.

What do I do if I have termites?

So, you think you have termites. First, it is important to note, that not all swarming insects are termites. Here is an easy guide to distinguish between flying ants and termites.

Termites

- broad waist
- wings are equal length
- straight antennae
- workers light in color (almost white)
- lose wings quickly after swarming
- 3/8" to 1/2" including wings

Ants

- three distinct sections of the body
- two pairs of unequal sized wings
- elbowed antennae
- workers look similar to winged versions
- do not lose wings quickly after swarming
- ranging in size depending on ant species

Call us for an Inspection!

If you see swarming insects and you cannot determine if they are termites or not, please contact A.W.E.S.O.M.E. Pest Service for an inspection. Our professional inspectors will be able to determine the specific invader and which treatment is best for your home.

How Are Termites Removed?

The system used treats the termites in your home in a way that will remove the colony and not just the surface invaders. Termites can live underground, so it is important to manage the whole area to prevent repeat infestations. A.W.E.S.O.M.E. uses Premise, a non-repellent substance that will adhere to termites that come in contact with the substance, and they will then carry it back to the colony. This slower acting control allows all the termites to be eliminated with no possibility of a return invasion. The liquid treatment is injected into the soil where any potential foraging termites will pass through it. This stops termites from re-infesting.

Description of Treatment

Premise is applied in the soil along the exterior foundation walls to create a continuous treatment zone around the structure. The substance remains in the soil as a barrier guarding the perimeter of your home. Any new invaders must march through the barrier. The substance sticks to the new invaders and they carry it back to their colony and termite trouble becomes a thing of the past. Premise has virtually no odor, which means you and your family won't notice a thing. Premise offers 100% control, a long residual, and the ability to manage colonies faster than a baiting system. All applications are guaranteed, and quarterly inspections are included.

A.W.E.S.O.M.E. Pest Service will tailor a custom pest management program specifically for your home. This is a sure-fire way to get rid of termites. But if termites dare show any activity between your quarterly inspections, call us and we will re-inspect and stop them in their tracks. Don't wait! Termite damage can cause the need for thousands of dollars' worth of repair. Let us help you protect your home with our professional pest management program. Satisfaction guaranteed.
