

SLIT/POWER SEEDING

What is Slit/Power Seeding?

Slit/Power seeding is done with a machine that has discs that cut through the thatch and top layer of soil and incorporate seed into the grooves that have been created. This creates a great place for the seed to germinate.

When is Slit/Power seeding needed?

Slit/Power seeding is usually done on new lawns, thin lawns or in large areas of the property that are bare. This will create a full lawn quickly because of the dense seeding.
