LED MESSAGE BOARDS

High-resolution 10mm and 12mm displays are ideal for locations with significant pedestrian traffic, a nearby busy intersection or traffic congestion. The closer your LED sign is to your audience, the greater the visual impact and messaging flexibility. The tight pixel pitch on high resolution signs will allow you to display more graphics and content on your sign, even if square footage is limited. Theaters, entertainment venues, sports arenas and shopping malls are just a few examples of businesses using this type of sign to take advantage of close viewing range. Our 10mm and 12mm displays are also well-suited for locations with space constrictions, either from local zoning ordinances or because of an existing structure.

Our medium-resolution displays are a powerful messaging tool for businesses of all types. These street-side applications, especially up in the air, can offer great impact at a great price. If your location has traffic traveling by at 40mph or faster, or your location is distanced away from pedestrian and vehicular traffic, a medium resolution can offer the perfect balance of sign size and resolution to give you the greatest attention-grabbing power. Many businesses have found that by choosing a medium-resolution sign they can afford to install a larger display allowing them to truly stand out in their community.

Watchfire's standard resolution displays are best suited for locations further from the roadway and for much faster moving traffic. The affordability of these models is a great opportunity for businesses to choose a larger display and truly call attention to their location, especially if they aren't very visible from the roadway. These signs are particularly well suited for highway and interstate traffic moving at speeds greater than 55 mph.

MONOCHROME SIGNS

A Watchfire 19mm monochrome display is an affordable option for businesses and organizations that are looking to replace changeable copy boards. They are also a great option for businesses that must adhere to local zoning ordinances restricting LED displays to text or a single color.
