

# Leverage Discovery

## Package: Citrix XenApp

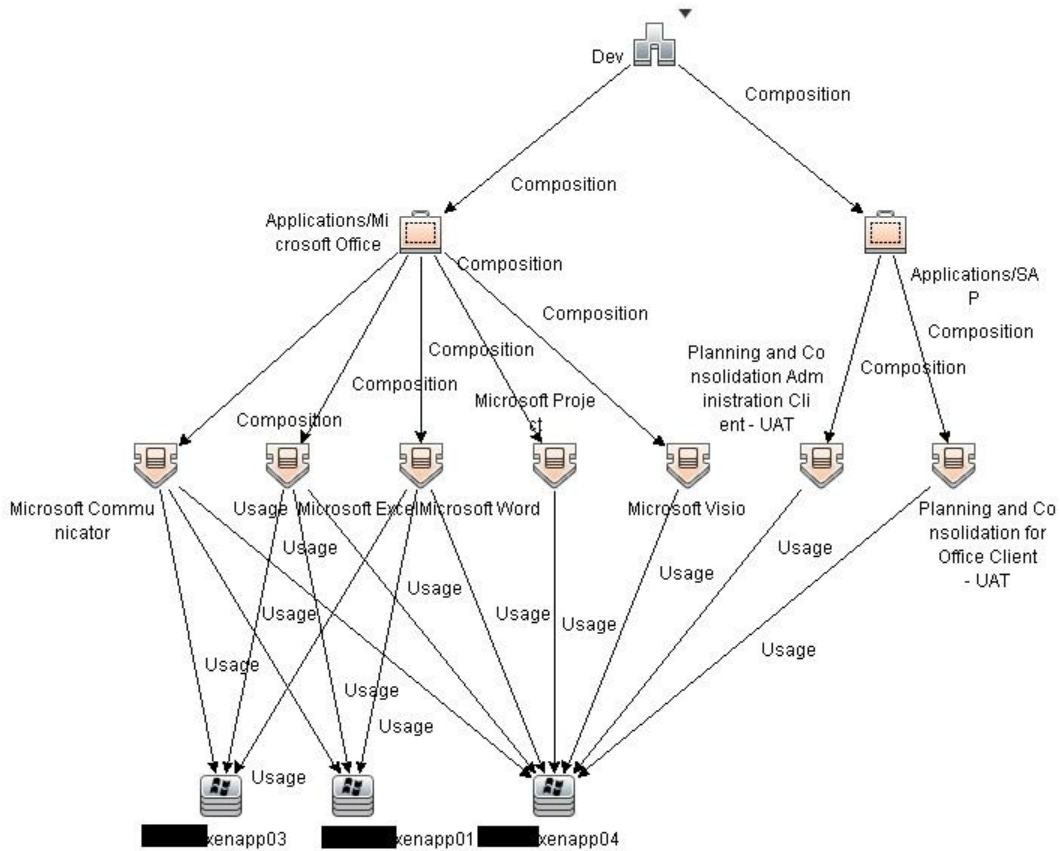

This DDM package discovers the topology of XenApp and maps applications across that topology. The package initially uses the WMI protocol to discover the existence of a server hosting XenApp. Then it follows the Spiral Discovery process to find Servers, Zones, the Farm, configured Applications and their folders, and which Applications are deployed onto the Servers.

CI Model:

The following TQL represents the Citrix XenApp layout.

Sample results from running this package:

Support matrix:

Citrix platform	OS platform	DDM 9.02	DDM 9.04
Citrix XenApp 6, Enterprise Edition	Windows Server 2008 R2, running on HP ProLiant hardware	✓	✓
Citrix XenApp 6, Enterprise Edition	Windows Server 2008 R2, running on VMware virtualized hardware	✓	✓
