Matrix™ Crossweb

Package Labeler

Congratulations on your Matrix™ Crossweb Package Labeler purchase. The labeler was designed to give you years of trouble-free operation.

Please read this owner's manual to gain the maximum benefits of your labeler and its different components.

A note about cleaning: Given all the various ways equipment is used in different environments, we recommend the owner consult sanitation experts on how to properly clean each piece of machinery in their plant and to do bacterial testing to insure that the equipment is cleaned properly.

General

This owner's manual contains information pertinent to your Matrix™ Crossweb Package Labeler. Basic instructions and maintenance information is provided. Please read carefully. Failure to do so could result in bodily injury and/or damage to the equipment.

Receiving Problems: As in all cases, before signing the bill of lading, be sure all items have been received as listed and there is no damage in shipment. If needed, a claim must be made immediately to the local truck line office and noted on the bill of lading.

Please fill in the information from the bill of lading and the product identification tag.

Specifications

Construction: Stainless steel, Delrin, and PET-P construction

Electrical:
208-240 VAC, 50/60 Hertz, single phase, 6.0 amps

NOTE: Power must be maintained at all times to the labeler control, even when the labeler is turned off. This is to maintain power to an internal, thermostat controlled heater to reduce condensation in the electronics. It is recommended that a separate power drop be made to the labeler. It is internally fused to 4A.

Note: Specifications are subject to change at any time.

SAFETY

Personal Safety

The procedures and guidelines herein must be followed precisely to avoid problems that can result in property damage, personal injury, or death. If you have any questions related to this information, please contact Ultravac Services Inc. at (800) 777-5624.

⚠ DANGER Hazardous voltage.
Disconnect and lockout power before servicing machine or cleaning. Do not remove panels unless power has been disconnected and locked out at risk of electric shock hazard.

⚠ WARNING

Read and understand owner's manual before using this machine. Failure to follow operating instructions could result in personal injury or damage to equipment.

⚠ WARNING Moving parts. Pinch point hazard.
Do not put hands into machine while running. Ensure that the conveyor is not operating prior to freeing product or handling conveyor. Conveyor creates pinch point and draw in hazards.

⚠ CAUTION Hot surfaces. Do not touch.
To avoid possible skin burns disconnect and lockout power. Allow surfaces to cool before servicing or cleaning.

⚠ CAUTION Cleaning agents.
Do not get the cleaning agents in eyes, on skin, or on clothing. Always wear rubber gloves, goggles, and protective clothing when contact is likely. Consult product manufacturer for specific details.

Signal words used in classification of potential hazards are defined as follows:

DANGER**:** Indicates an imminently hazardous situation, which, if not avoided, may result in death or serious injury.

WARNING**:** Indicates a potentially hazardous situation, which, if not avoided, could result in death or serious injury.

CAUTION**:** Indicates a potentially hazardous situation, which, if not avoided, may result in minor or moderate injury. Caution also indicates actions that may cause property damage.

General Safety Guidelines

Obvious safety guidelines should be observed.

- Be sure to unplug the power cable to the labeler before any maintenance work is performed. Turning off the power switch will not remove all voltage internally.

- Never go near the machine with loose hair, clothes, bracelets, chains, rings, ties, etc. to avoid the chance that they may become tangled in the moving parts of the machine.

- As a consequence, the operator shall wear suitable clothes for the working environment and the situation he/she is in.

- If service is necessary, contact Ultravac Services Inc. or a qualified service agency.

Installation Guidelines

- It is the owner's responsibility to ensure that the Matrix™ Crossweb Package Labeler installation conforms to all local, state, and national codes and regulations.

- For safe operation, the labeler must be kept clean. A thorough weekly cleaning schedule is recommended with a basic daily cleanup procedure. See *MAINTENANCE*, page 4.1, for additional details on cleaning your labeler.

- Never make any additions or modifications to the Matrix™ Crossweb Package Labeler without contacting Ultravac Services Inc. This will void the warranty and could adversely affect the safety or operation of your labeler.

- DO NOT attempt to operate your Matrix™ Crossweb Package Labeler without reading and understanding this entire owner's manual. Any questions should be directed to Ultravac Services Inc.

STARTUP

Installation

The installation of the Matrix™ Crossweb Package Labeler should be performed by a Ultravac Services Inc. service technician or qualified Packaging Machine OEM technician. If you are installing the Matrix™ Crossweb Package Labeler, contact Ultravac Services Inc. at (800) 777-5624 for telephone assistance.

NOTE: 220 VAC POWER MUST BE MAINTAINED CONTINUOUSLY TO THE LABELER IN HARSH ENVIRONMENTS.

Power must be maintained at all times to the labeler control, even when the labeler is turned off. This is to maintain power to an internal, thermostat controlled heater to reduce condensation in the electronics. It is recommended that a separate power drop be made to the labeler. It is internally fused to 4A.

Model Identification

ULTRASOURCE LLC

Model No. PR42-11510 Serial No. 1023

The Matrix™ Crossweb Package Labeler model number is a nine-digit code that when broken down describes the separate components that make up your labeler. The example below shows how.

Model number detailed below:

PR 42 - 1 1 5 1 0

Unit Type/ Orientation		Chassis Web Width		Max. Label		Label Transport		Labeler Shifting		Motors		Printing	
PR	Right-Hand	32	320mm	1	150mm	1	150mm	0	No Shift	0	Standard	0	None
PL	Left-Hand	42	420mm	2	200mm	2	200mm	5	Shifting	1	High-Torque	1	Thermal Transfer
		52	520mm	9	Special	9	Special			2	Super-Torque	2	Markem, Transfer
		62	620mm									3	HS 330S
		72	720mm									4	HS 1000S
		82	820mm									6	Ink Jet
		99	Special									7	CCI
												9	Special

OPERATION

Pre-Run Checklist

- ✓ Make sure label transporter belts, tamp blades, and peel bar are free of labels or debris, clean as necessary.
- ✓ Make sure tension roller is locked down.
- ✓ Make sure label brake arms are down.
- ✓ Make sure label reel is tightened against label roll.
- ✓ Make sure dancer operation stops label roll from unwinding.
- ✓ Verify threading, particularly in peel bar area and label sensor area.
- ✓ Drain water from pressure regulator/water separator on the labeler.

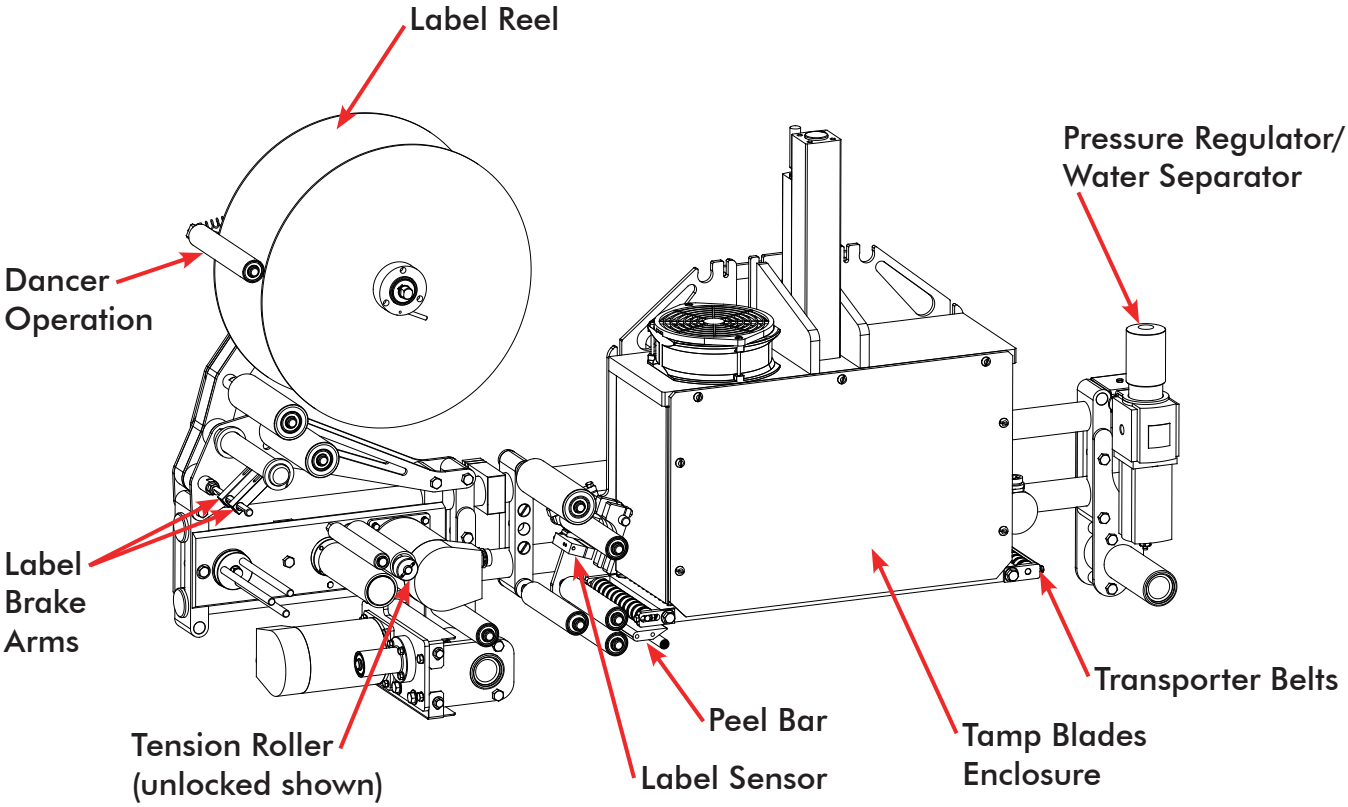

Figure 3.2

Operation Instructions

1. Turn on the Matrix™ Crossweb Package Labeler by turning the switch to the 'ON' position on the control cabinet.

    - For shifting or multiple row labelers - be aware of the machine "homing" at power up. Ensure the home sensor is between the EOT carriage sensor blocks.

2. Upon power up, the Matrix™ Crossweb Package Labeler will be in either the STOP condition and display the MAIN menu (see page 3.9) or the ready to run condition and display the RUNNING menu (see page 3.10).

3. From power up, the Matrix™ Crossweb Package Labeler will operate with the parameters that were last active at power down. Individual parameters may then be changed (see EDIT screen, pages 3.11-3.13) or a new set of parameters can be loaded from memory (see LOADING PROGRAMS screen, pages 3.10 and 3.14).

4. This owner's manual section is organized by screens. Each section details actions that can be performed from the operating screens.

5. To set up the Matrix™ Crossweb Package Labeler for a new label and application, the following steps must be performed:

    - Thread the label roll into the labeler. Ensure tension roller is engaged. See pages 3.5-3.8 for threading diagrams.

    - Perform a label sensor sensitivity adjustment, see pages 3.16 and 3.17.

    - Perform a label measuring run, see page 3.9.

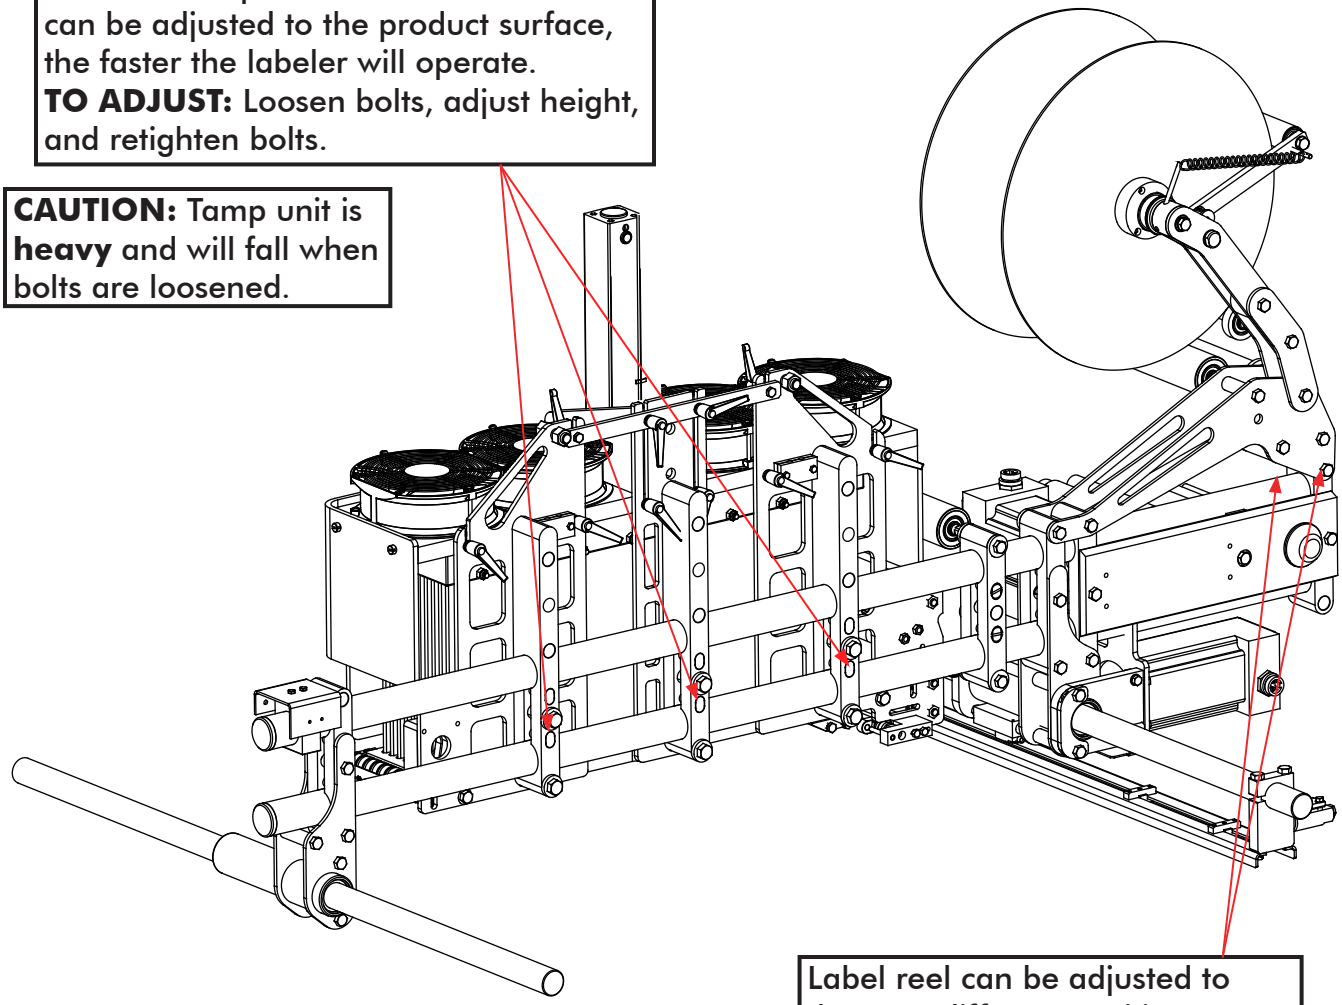
    - Set each of the parameters (see page 3.13) and return to the RUNNING screen (see page 3.10).

Operation Instructions

5. The Tamp Unit and Label Reel positions are also adjustable as shown below.

Tamp unit position should be adjusted to minimize tamp stroke. The closer the unit can be adjusted to the product surface, the faster the labeler will operate.
TO ADJUST: Loosen bolts, adjust height, and retighten bolts.

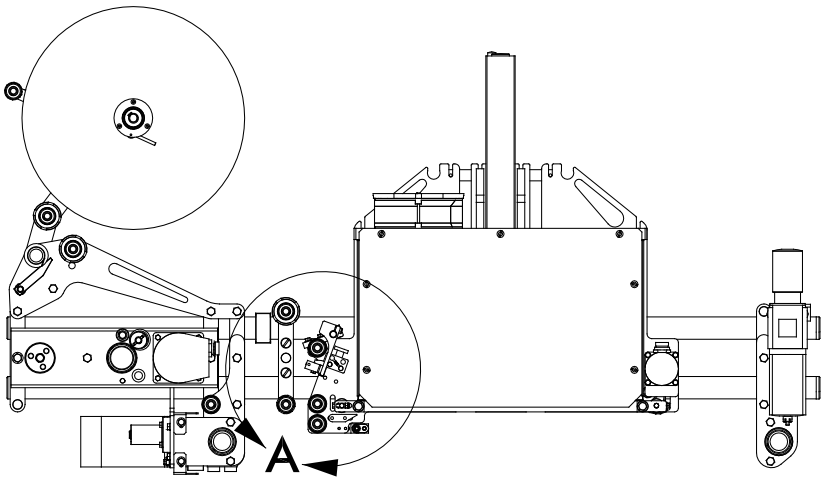
CAUTION: Tamp unit is **heavy** and will fall when bolts are loosened.



Label reel can be adjusted to three (3) different positions to provide the optimal ergonomic loading position (depending on installation).
TO ADJUST: Remove bolt, rotate bracket, and reinstall bolt.

Operation Instructions

6. The Label Sensor and Peel Bar positions are also adjustable as shown below.



The peel bar may be adjusted. **FOR LARGER AND NON-RECTANGULAR SHAPED LABELS:** Move the peel bar away from the tamp blades. **FOR SMALLER LABELS:** Move the peel bar closer to the tamp blades.

The label sensor may be adjusted to two (2) positions. This may be required if the desired peelover cannot be obtained.

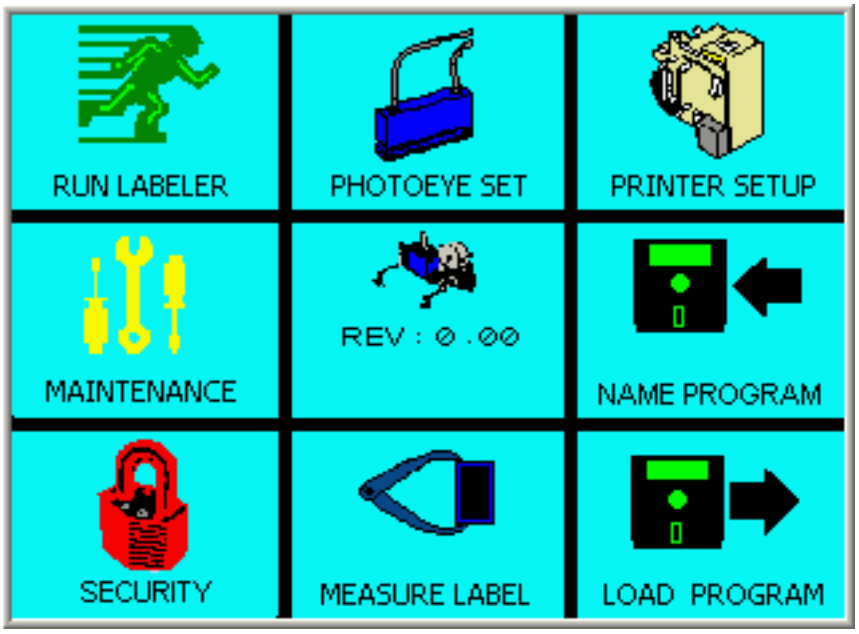
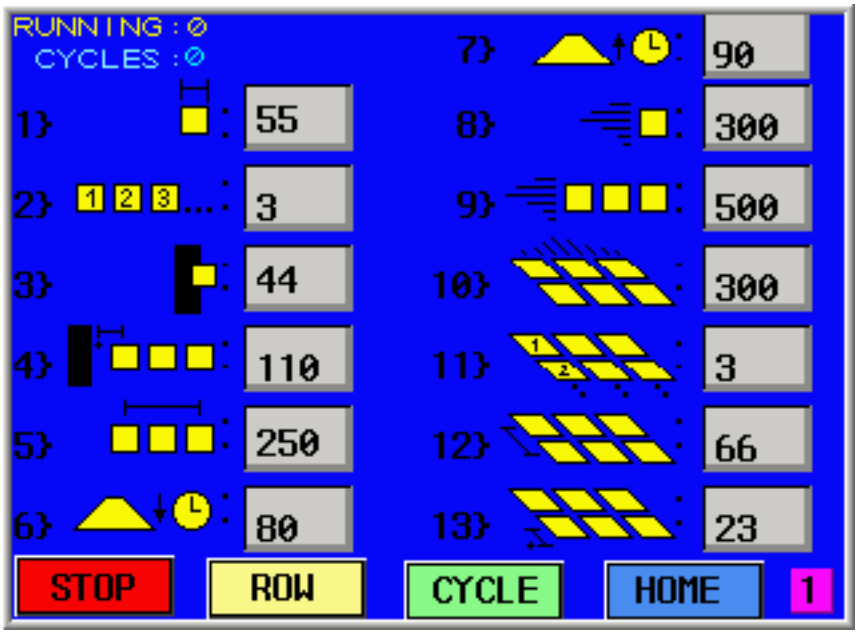
Main Menu Touchscreen

	RUN LABELER	Puts the labeler into the RUNNING mode where labels will be dispensed. Also allows editing of parameters. See page 3.10.
	PHOTOEYE SET	Displays instructions on setting the label sensor sensitivity. See pages 3.16 and 3.17.
	PRINTER SETUP	Setup OEM300 Hot Stamp or other optional printers. See page 7.4.
	MAINTENANCE	Press to set the motor accelerate rates, test individual motors, and set motor count. See page 4.20.
	REV : 0.00:	Displays software revision, special options, and a graphic indicator (package/film)
	NAME PROGRAM	Names the current program. See page 3.14.
	SECURITY	Enables supervisors to change passwords. See page 3.15.
	MEASURE LABEL	Performs a label measuring run (or the label length can be entered directly).
	LOAD PROGRAM	Loads a set of saved parameters. See page 3.14.

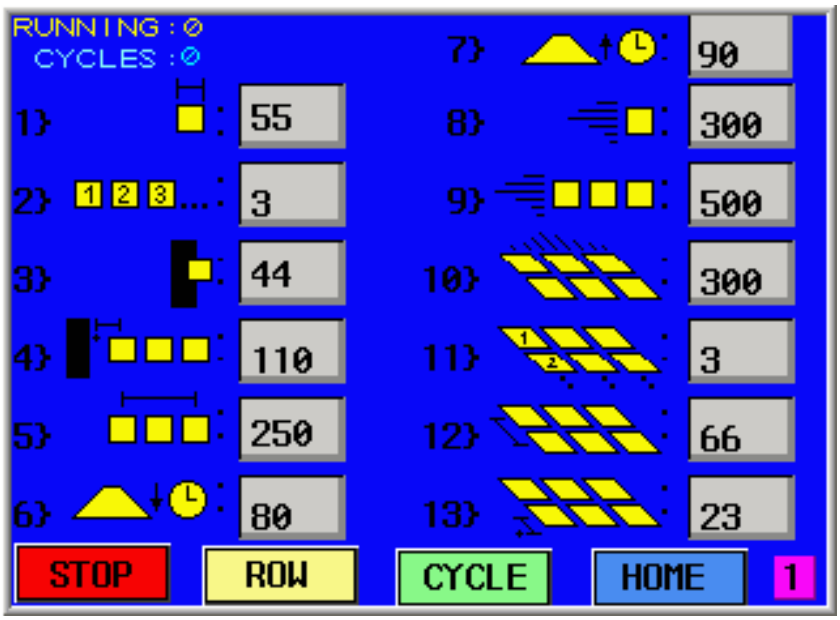


Running Menu Touchscreen

STOP	STOP	Touch the STOP key to stop the labeler and go to the MAIN menu
ROW	ROW	Dispenses row of labels without tamping
CYCLE	CYCLE	Executes one complete cycle by placing one label set
HOME	HOME	Sends the labeler to row #1 position (if labeler is multi-row)
1	Signal Indicator	Displays receiving signal from rollstock machine. (1=open signal; 0=closed signal). See schematic, view 2 on pages 5.7 or 5.11.
RUNNING : 0 CYCLES : 0	RUNNING : CYCLES :	Displays current program name, number, and cycle count



Edit Menu Touchscreen

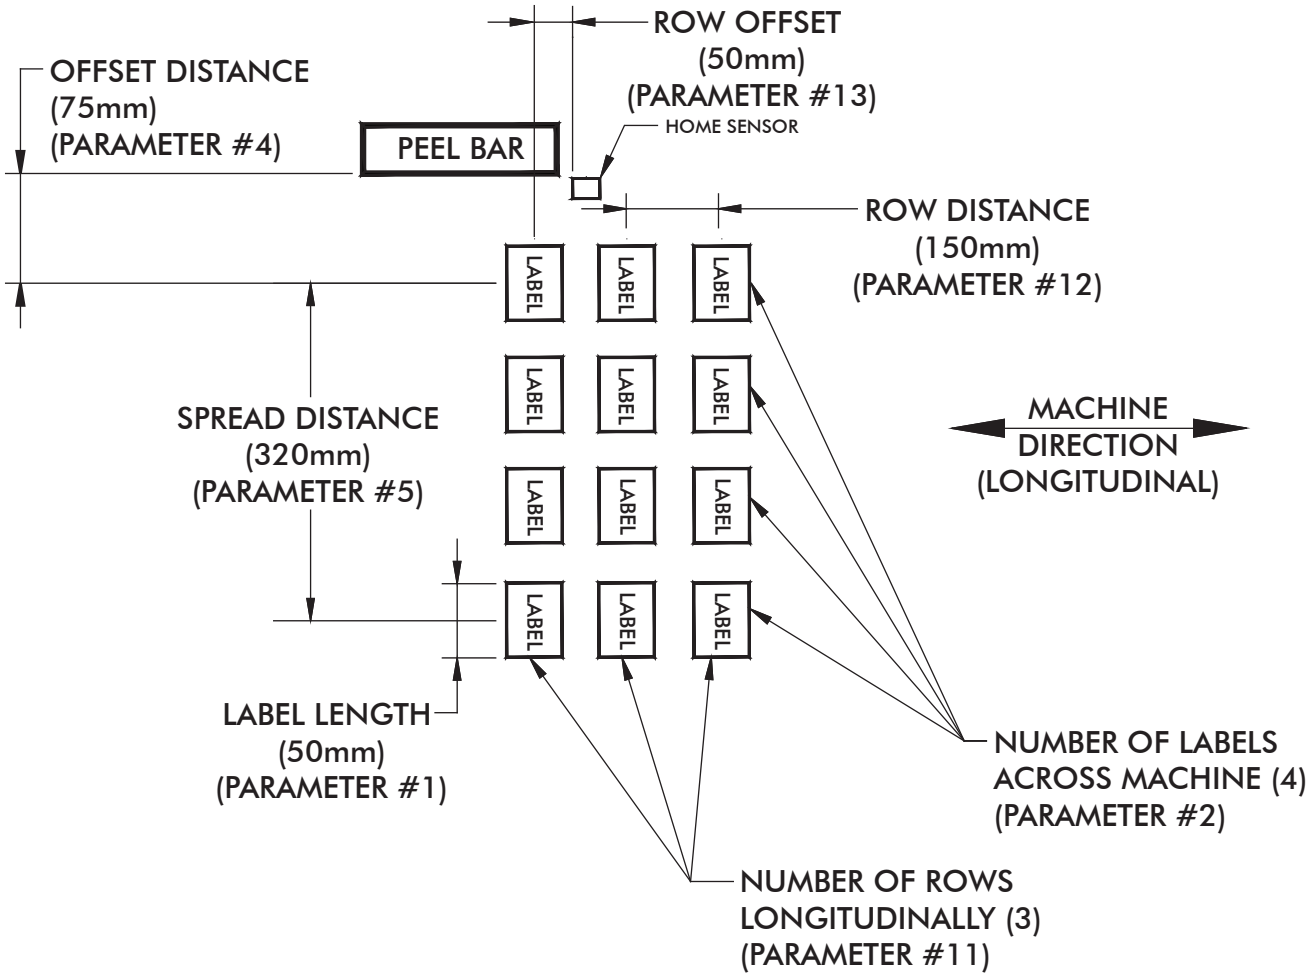


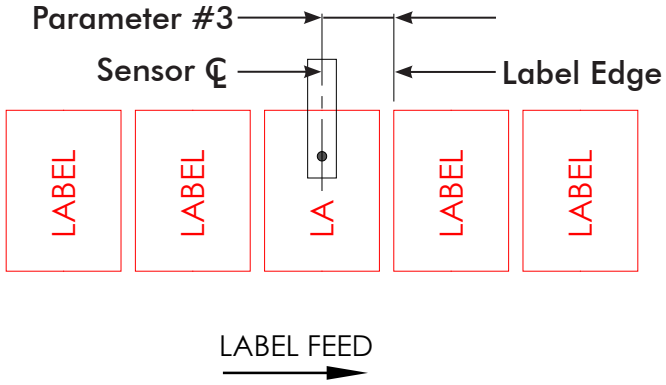
Parameter No. and Name		Description
1	Label Length	Directly edited or measure run (mm)
2	Labels per Row	Number of labels per row across the machine
3	Label Sensor Distance	Distance from label sensor to trailing edge of label (mm)
4	Offset Distance	Distance from center of last label to peel bar (mm)
5	Spread Distance	Distance from center of first label to center of last label (mm)
6	Tamp Time	Down stroke of pusher blades (Range: 50 to 250ms)
7	Tamp Wait Time	Up stroke of pusher blades (Range: 50 to 250ms)
8	Label Speed	Standard range: 200 to 1000mm/sec
9	Transporter Speed	Standard range: 200 to 2000mm/sec
10	Row Shift Speed	Standard range: 150 to 500mm/sec
11	Number of Rows	Number of rows longitudinally
12	Row Distance	Distance (mm) (Minimum value: 20)
13	Row Offset	Offset from home sensor (mm) (Minimum value: 10)

If the row offset requires a setting outside these limits, then the home proximity sensor must be readjusted to allow the shifting head to locate the sensor. See page 3.13 to change parameters.

Note: After editing a parameter on a multiple row (shifting) labeler with ROWS = 1, press the HOME button to re-home the labeler to set the holding current on the motor to maintain a locked position. This only applies if parameters are edited. The labeler will automatically home and lock when powered up.

Change Parameter Instructions





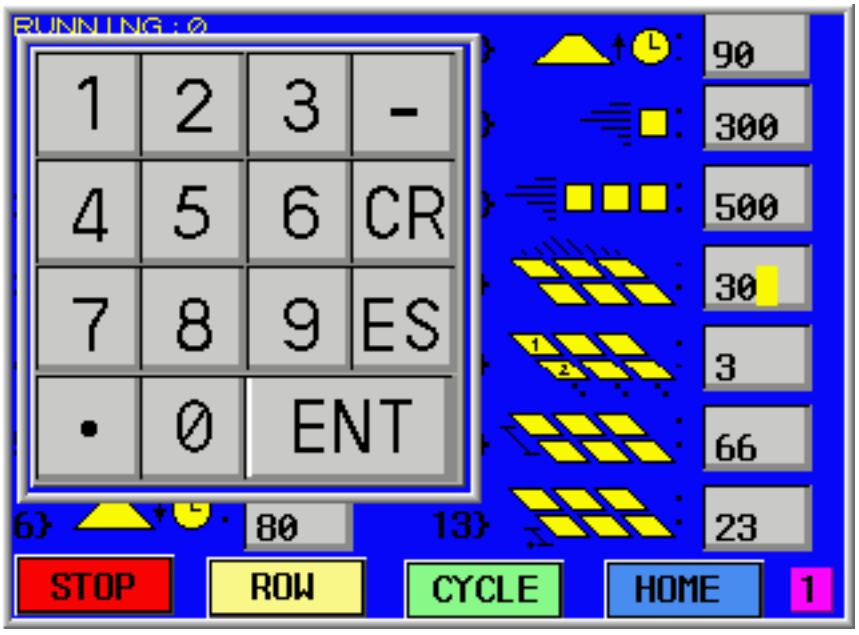
Change Parameter Instructions

1. Touch the desired parameter's box. To copy one program to another, see the Maintenance section on pages 4.20 and 4.21.
2. A yellow cursor will flash on the selected number and a keypad will be displayed to enter the value desired.
3. After entering value, press the ENT button.
4. After pressing the ENT button, the system will automatically save the value into the current program.
5. Press the STOP button to return to the MAIN menu.

NOTE: Labeler will be interrupted during the editing process. When the Matrix™ Labeler is powered down, the current parameters are stored in nonvolatile memory and are automatically reloaded on power up. The parameters that are saved include the thirteen (13) settings listed on the 'EDIT SCREEN' and all the current printer parameters listed on the 'PRINTER SCREEN' page.

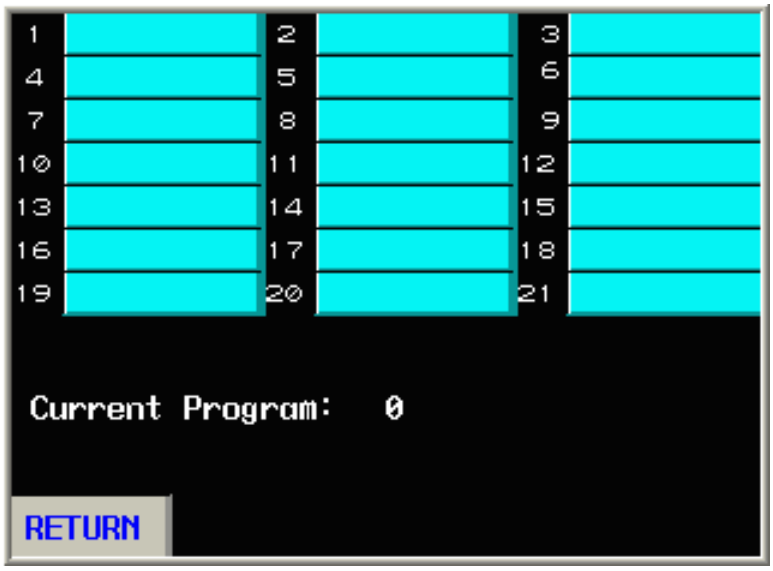
Any editing done on a parameter in a program is automatically saved.

The label sensor setting is local and not controlled by the PLC. The label sensor adjustment, once set, is fixed until readjusted using the same procedure (pages 3.16 and 3.17). The label sensor may need to be readjusted if labels or backing paper have a significant change in color.



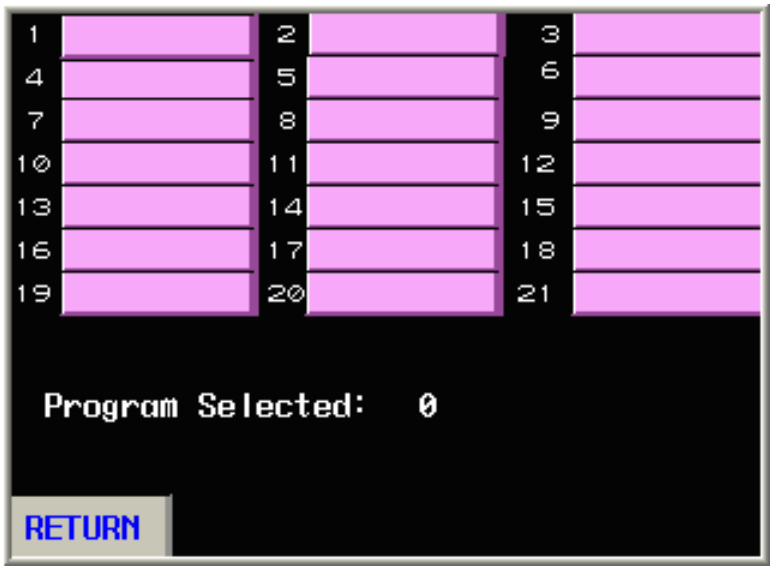
Name Program Touchscreen

This screen displays the current names of all sets of operating parameters (programs). To change a name, press the file number and enter a new name. The name can be up to thirteen (13) characters in length.



Load Program Touchscreen

This screen displays the current sets of operating parameters (programs). To load a program into current operation, press the file number/name and the system will immediately start operating with those parameters.

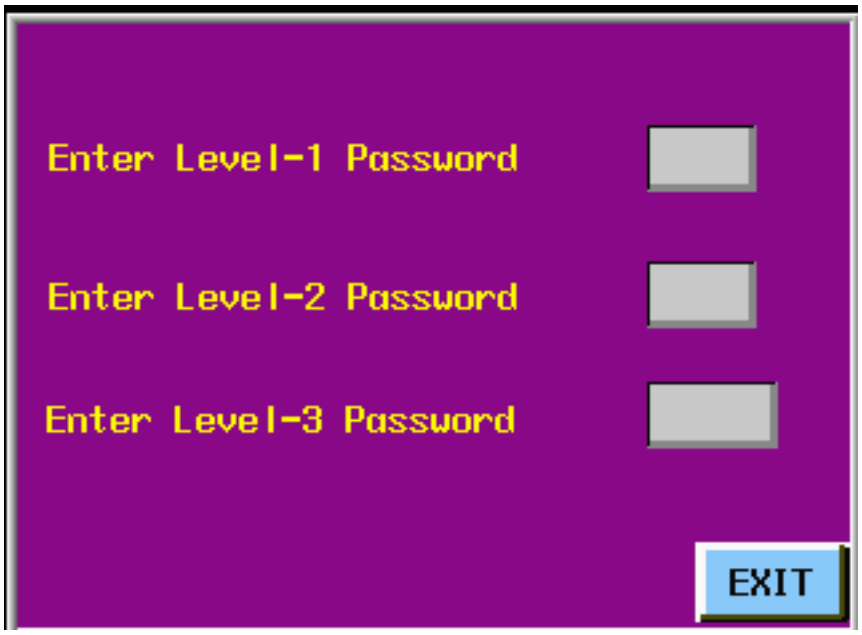


Security Touchscreen

The Matrix™ Crossweb Package Labeler control has a two-level security system. A separate password is entered for each level. Once entered, the system will grant full access to all functions permitted at that level until the system is powered off. After a power up, the codes must be entered to regain access.

- LEVEL-1 PASSWORD: Allows operators to change the thirteen (13) basic operating parameters. The initial password is '456.'

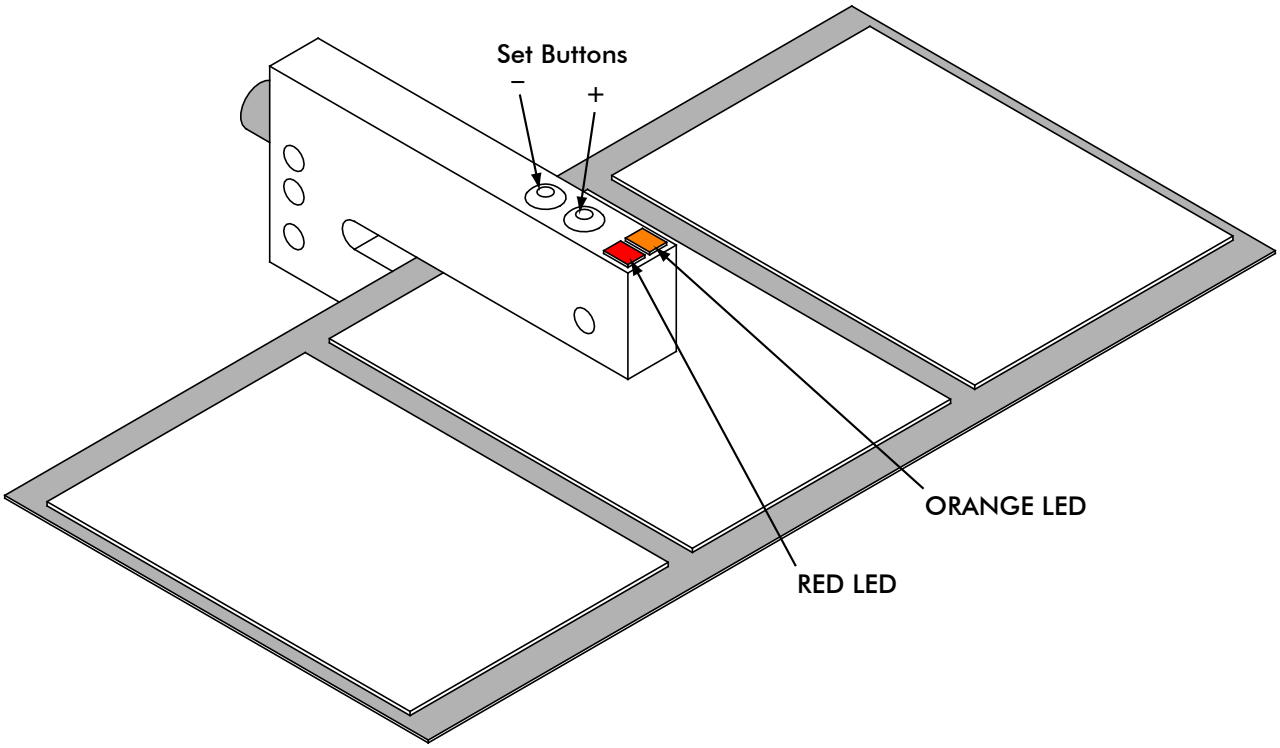
- LEVEL-2 PASSWORD: Allows the maintenance personnel to gain access to the maintenance screens for options, testing, and setup. The LEVEL-1 password can be turned ON or OFF at this level (see MAINTENANCE screen). The initial password is '789.'
- LEVEL-3 PASSWORD: The Level 3 password is reserved for factory trained service technicians.



NOTE:

1. Loading a different program does not require any security level access.
2. The passwords can be changed in the Maintenance section, see pages 4.20 and 4.32.

SICK Label Sensor Setup



1. Power up machine.
2. Place backing paper only into the sensor slot.
3. Press and hold the "-" set button until the RED LED flashes and the ORANGE LED turns OFF.
4. Press and hold the "+" set button until the RED LED flashes and hold until the ORANGE LED just turns ON.
5. Release the "+" set button.
6. Test the sensor by passing the label gap in and out of the sensor, the ORANGE LED should only turn ON in the gap and off as the label is passed through the sensor.
7. Sensor is ready for operation.

Locking/Unlocking

If the set buttons are pressed for three seconds and released, the sensor will become locked and the RED LED will remain illuminated. To unlock the sensor, press the set buttons for three seconds and the RED LED should turn off.

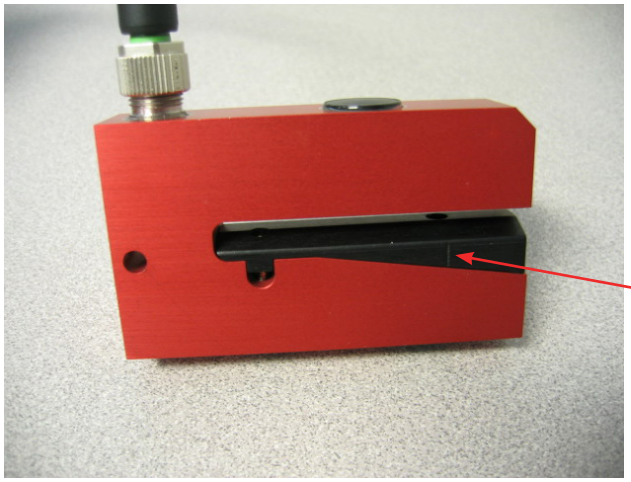
Reversing Logic

If the set buttons are pressed for six seconds and released, the sensor will reverse logic and the ORANGE LED will remain illuminated over labels instead of over the backing paper. To change the logic back to the correct state, press the set buttons for six seconds and the ORANGE LED should only illuminate over the backing paper.

Clear Label Setup

1. Make sure the sensor is mounted and connected to the labeler and power is turned ON. See Section 5, Cable Schematics for connection locations.
2. Insert labels and backing paper into the sensor slot and over the sensor's mark, located on each side of the sensor.
3. Hold the labels and backing paper in the sensor, press, and release the button on the sensor. The GREEN LED will flash.
4. Manually pull the labels and backing paper so that five (5) to ten (10) label gaps pass through the sensor slot.
5. Press and release the button. The GREEN LED will remain ON.
6. The sensor is now ready for use.

NOTE: The sensor should operate with a wide variety of labels and rarely requires readjustment.



MAINTENANCE

Prior to Cleaning

Every environment and application is different; therefore, UltraSource LLC cannot provide cleaning instructions to guarantee microbiological sanitation. UltraSource requests that the owner of this machine consult with sanitation experts to review the unit working in their particular environment to develop a robust cleaning schedule and methodology, followed by bacterial testing to ensure satisfactory cleaning procedures are followed.

NOTE: Use a detergent/sanitizer that will not degrade stainless steel or plastic. The labeler may be rinsed using a low pressure spray only. The control cabinet should be wiped clean and no water spray should be directed toward it.

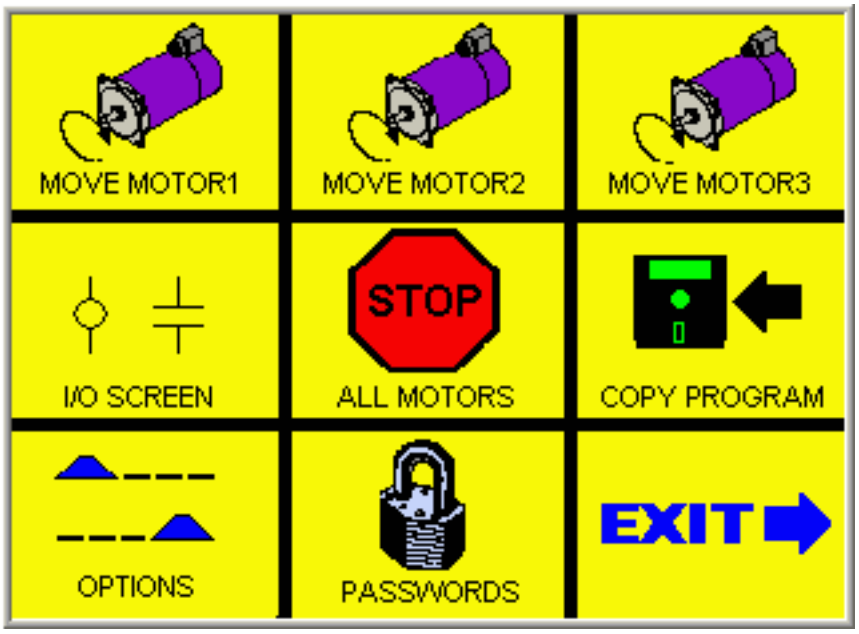
⚠ CAUTION *Cleaning agents.*
Do not get the cleaning agents in eyes, on skin, or on clothing. Always wear rubber gloves, goggles, and protective clothing when contact is likely. Consult product manufacturer for specific details.

Cleaning Instructions

Turn off main power switch and disconnect air supply (or turn down to zero using regulator), remove air line at the tamp cylinder, remove tamp cylinder cable at the cylinder, and disconnect fan cables. Then remove the upper section of the tamp unit (including tamp blades). The tamp blades can then be dipped into a solution of cleaner and water, but do not submerse the fans directly.

Maintenance Screen

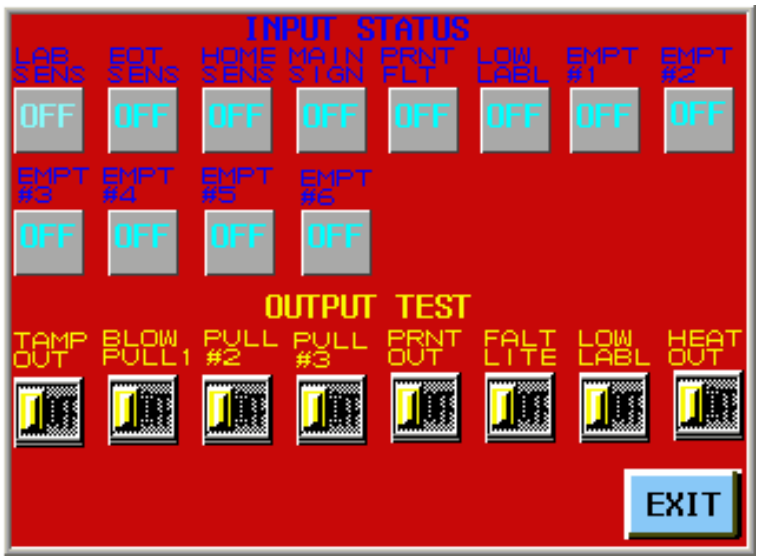
	MOVE MOTOR 1	Press to test run label head motor
	MOVE MOTOR 2	Press to test run transporter motor
	MOVE MOTOR 3	Press to test run shift motor **Caution:** Be sure the labeler can move freely 250mm in each direction
	I/O SCREEN	Press to enter I/O test screen. See page 4.21.
	ALL MOTORS	Press to stop motor test
	COPY PROGRAM	Press to copy programs **Caution:** Destination program will be overwritten. See page 4.21.
	OPTIONS:	Press to enter options screen. See page 4.22.
	PASSWORD	Press to change passwords. See page 4.32.
	EXIT	Returns to main screen



I/O Screen

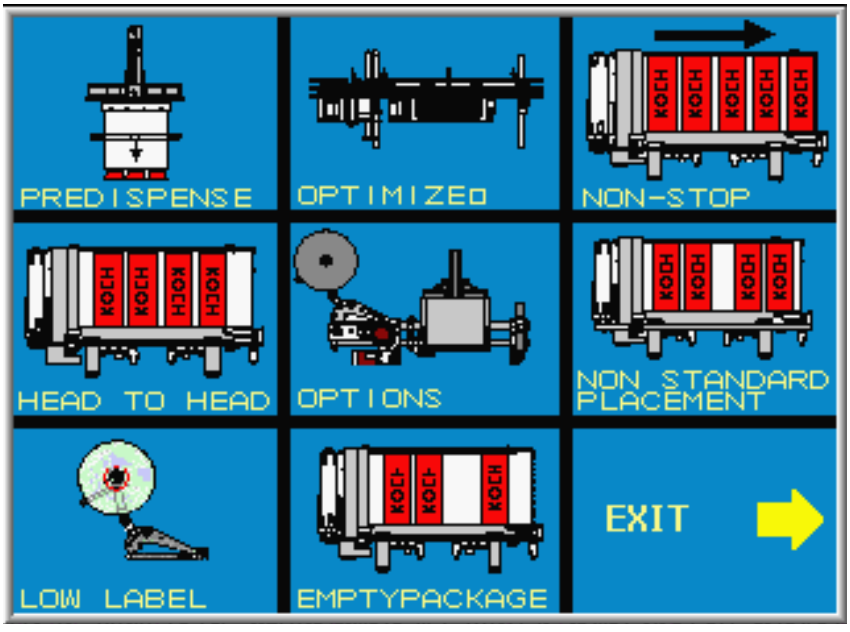
All input status indicators are displayed on the screen as shown. Input status is also indicated by RED LEDs on the front edge of the motion control card.

Each output can be tested by pressing and holding the individual button. All outputs are also indicated by RED LEDs on the PCB in the control cabinet.



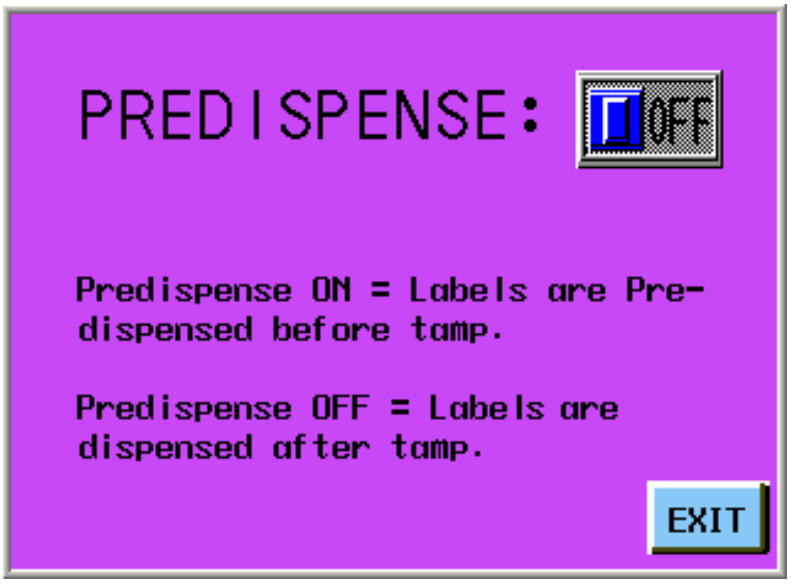
Options Screen

	PREDISPENSE	Press to set predispense screen. See page 4.23.
	OPTIMIZE	Press to set shift optimized screen. See page 4.23. (Applies to shifting package labelers.)
	NON-STOP	Press to set non-stop high-speed operation. See page 4.24.
	HEAD-TO-HEAD	Press to set head-to-head label operation. See page 4.25.
	OPTIONS	Press to go to miscellaneous options. See page 4.26.
	NON-STANDARD PLACEMENT	Press to set custom spacing operation. Allows for non-symmetrical spacing up to a total of six labels across the machine. See page 4.29.
	LOW LABEL	Press to set low label detection operation. See page 4.31.
	EMPTY PACKAGE	Press to set empty package detection operation. See page 4.31.



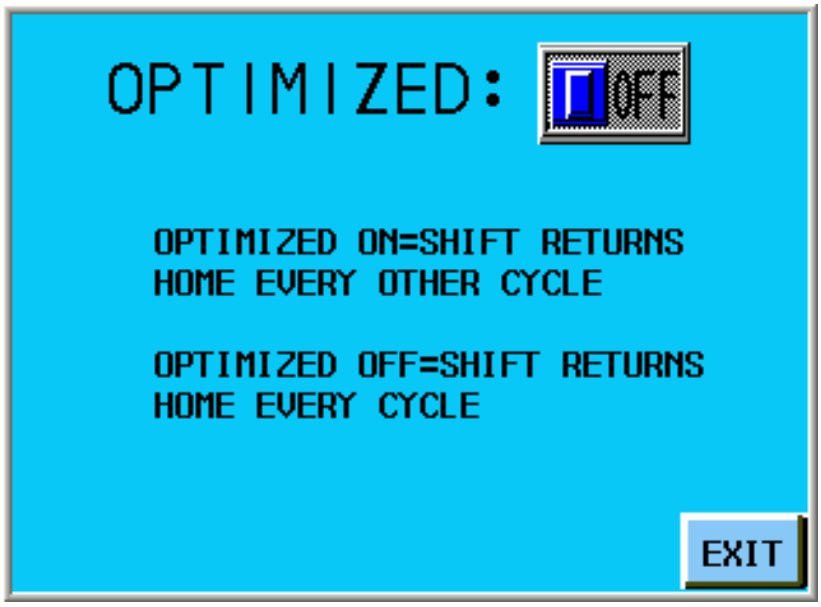
Predispense Screens

In the **PREDISPENSE MODE**, the labeler will predispense the first row of labels before the labeling signal is received and tamp the first row immediately when the signal is received. This will speed up operation of the labeler.



Optimize Shift Screen

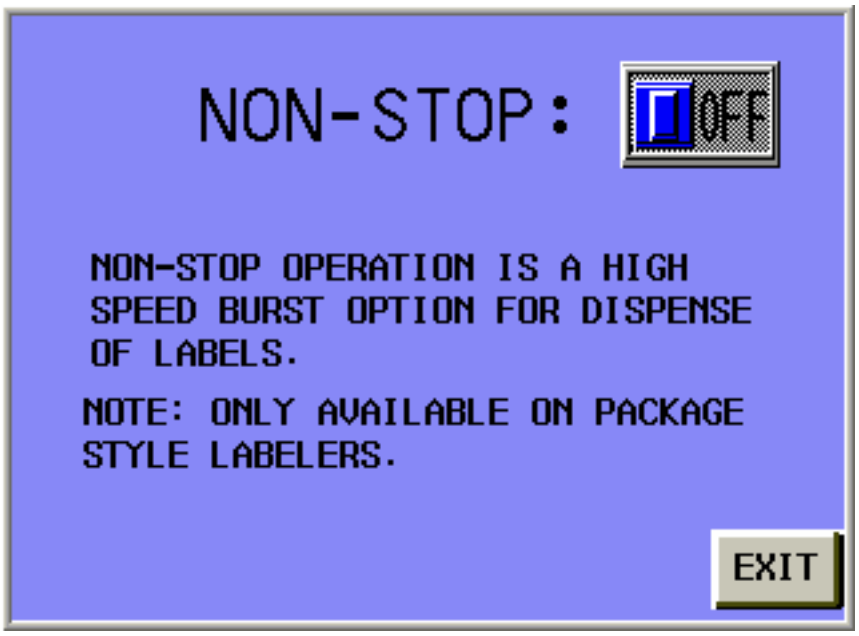
In the **OPTIMIZED MODE**, a shifting-type package labeler will not return to home every cycle. In the non-optimized mode, the labeler will go to the home position after each cycle. Operating in the optimized mode will also speed up the labeler operation.



Non-Stop Screen

(patent pending)

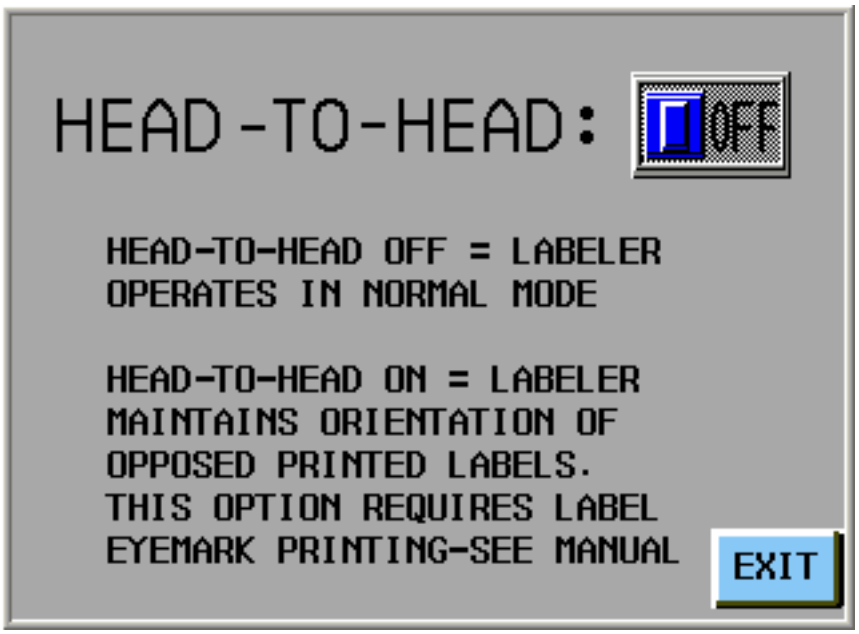
Non-Stop operation is for high-speed applications. Each row of labels are dispensed in a single dispense cycle. This is a global parameter; it is not stored by program. The peel over may need to be readjusted after turning this feature ON.



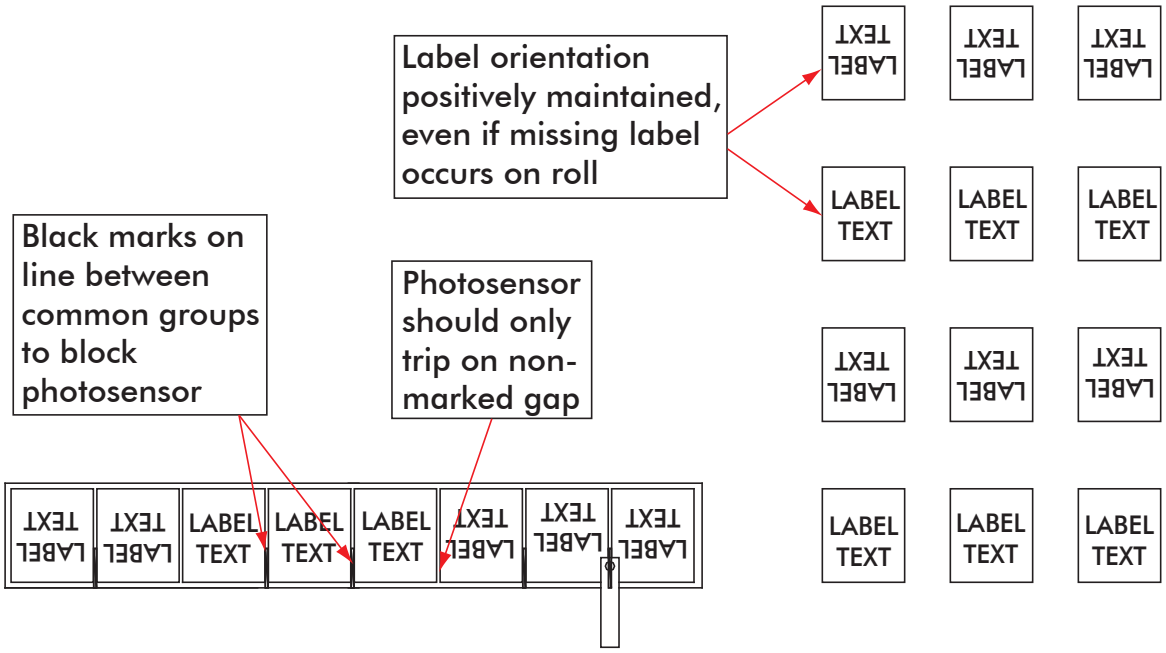
The NON-STOP option (patent pending) will dispense all labels for a given row without stopping between labels, resulting in a significant speed increase. When this option is selected, the transporter speed parameter will be removed, as this parameter is now internally calculated. This option is only available on Matrix™ Crossweb Package Labelers and cannot be used with the following other options:

- Date Code Printing (except Ink Jet/Laser options)
- Head-to-Head Labeling
- Random Spacing

Head-to-Head Screens

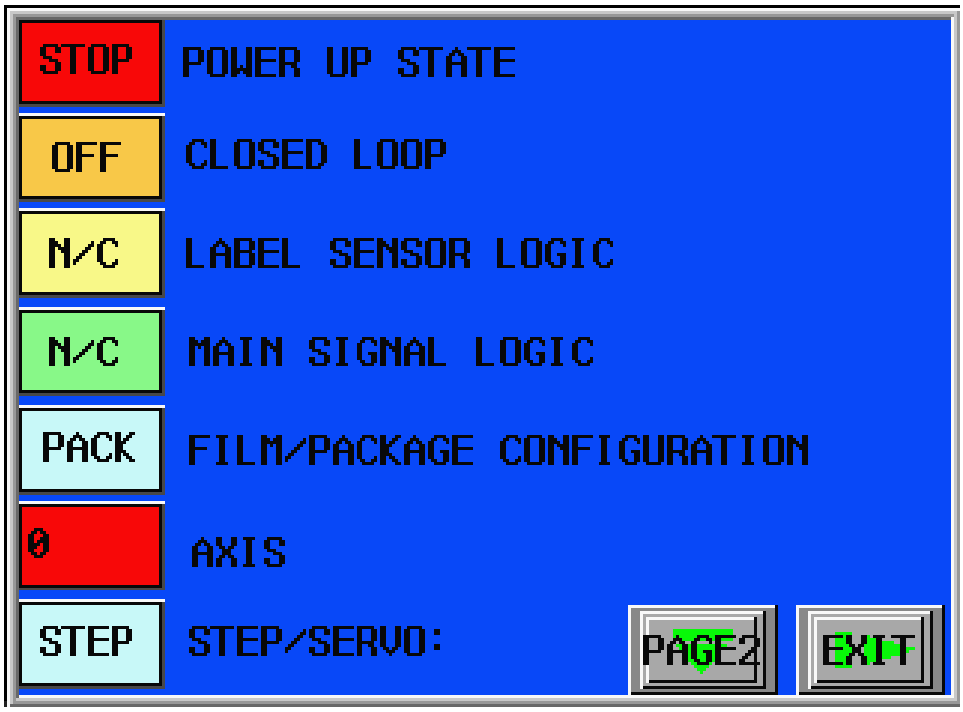


The **HEAD-TO-HEAD** option keeps sets of head-to-head printed labels synchronized.
NOTE: This option requires a label sensor blocking mark be printed on the backing material between label sets.



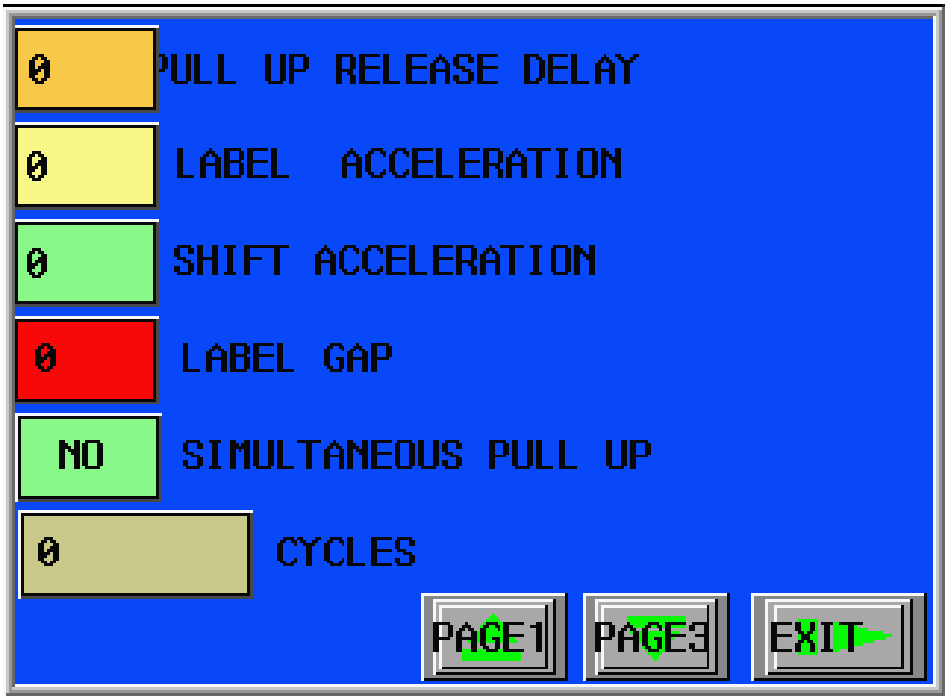
Miscellaneous Options, Page 1

POWER UP RUN/ STOP	Sets whether system will power up in the RUN or STOP mode
CLOSED LOOP	Sets closed loop (or busy) signal using fault output signal
LABEL SENSOR LOGIC	Reverses label sensor logic
MAIN SIGNAL LOGIC	Normally open labeler starts on make to break Normally closed labeler starts on break to make
FILM/PACKAGE CONFIGURATION	Sets Film Labeler or Package Labeler configuration
CONTRAST	Adjusts screen contrast
AXIS	Sets number of motors (2 or 3) Setting for shifting package labeler is 3
PULL UP DROP DELAY	Adds delay to pull up release (for Film Labeler only)
LABEL ACCELERATION	Adjusts label/transporter acceleration rate in mm/s^2 Standard Motor: 12000; High-Torque: 15000; Super-Torque: 18000
SHIFT ACCELERATION	Adjusts shift acceleration rate in mm/s^2 Standard Motor: 1500; High-Torque: 2000; Super-Torque: 2500
STEP/SERVO	Selects stepper or servo option on shift motor
CYCLES	Total machine cycle counter, press to reset
PAGE 2	Continued Miscellaneous Options



Miscellaneous Options, Page 2

PULL UP DROP DELAY	Adds delay to pull up release (for Film Labeler only)
LABEL ACCELERATION	Adjusts label/transporter acceleration rate in mm/s^2 Standard Motor: 12000; High-Torque: 15000; Super-Torque: 18000
SHIFT ACCELERATION	Adjusts shift acceleration rate in mm/s^2 Standard Motor: 1500; High-Torque: 2000; Super-Torque: 2500
LABEL GAP	Can be adjusted for special options
SIMULTANEOUS PULL UP	FILM LABELER ONLY. Fires pull up #1 and #2 together for longer index
CYCLES	Total machine cycle counter, press to reset
PAGE 3	Continued to Language Option



Language Option, Page 3

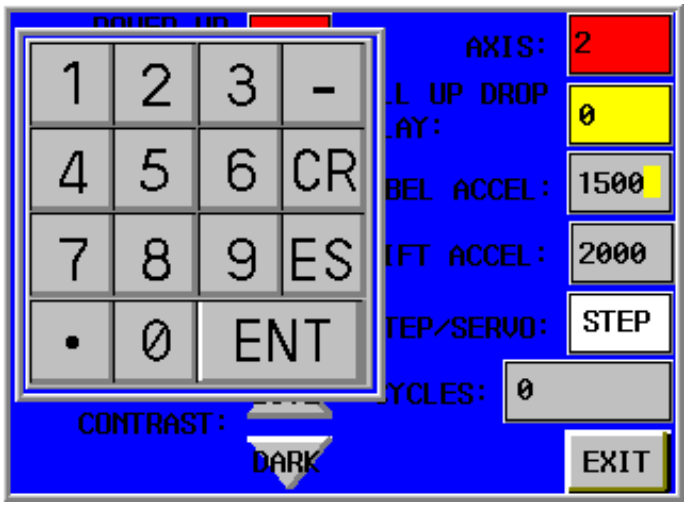
LANGUAGE	Select flag of country for desired language displayed

Change Parameter Instructions

The miscellaneous options editing screen is shown below. This allows the user to edit all of the parameters seen on page 4.26 and 4.27. The labeler will be interrupted during the editing process. When the Matrix™ Labeler is powered down, the current parameters are stored in non-volatile memory and are automatically reloaded on power up. These parameters are global and will apply to all programs.

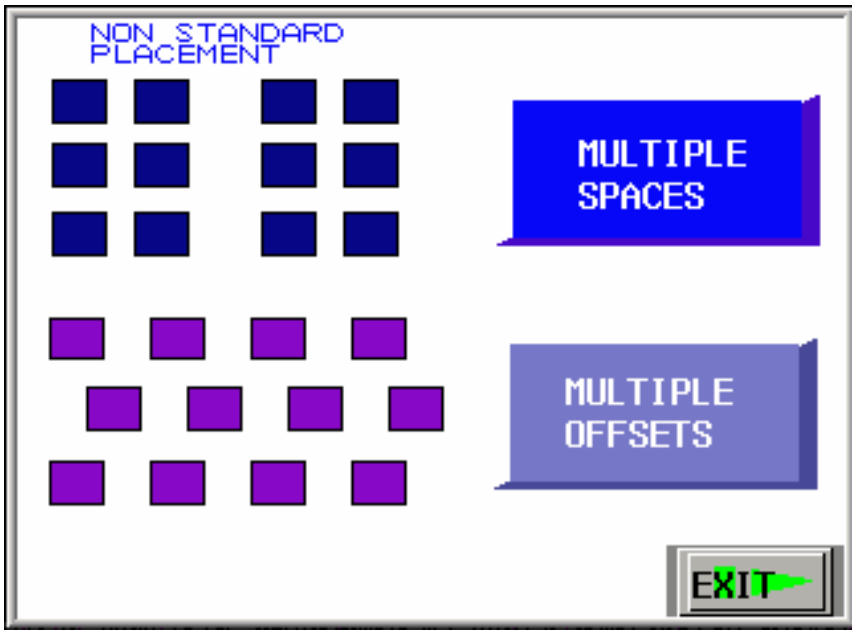
1. Touch the desired parameter's box.
2. A yellow cursor will flash on the selected number and a keypad will be displayed to enter the value desired.
3. After entering value, press the ENT button.
4. After pressing the ENT button, the system will automatically save the value.
5. Press the EXIT button to return to the MAIN menu.

NOTE: Labeler is not equipped with the servo option at this time.



Non-Standard Placement

The Non-Standard Placement screen is shown below. This allows the user to select multiple spaces or multiple offsets and to turn the options ON/OFF. Multiple spaces will allow the user to edit for up to eleven (11) spaces or twelve (12) individual labels. Multiple offsets will allow the user to edit for up to ten (10) offsets. The labeler will be interrupted during the editing process.



NOTE: See page 4.30 for editing of multiple spaces and multiple offsets.

Multiple Spaces Editing

1. Touch the desired parameter's box.
2. A yellow cursor will flash on the selected number and a keypad will be displayed to enter the value in millimeters desired.
3. After entering value, press the ENT button.
4. After pressing the ENT button, the system will automatically save the value.
5. Press the EXIT button to return to the MAIN menu.

Multiple Offsets Editing

1. Touch the desired parameter's box.
2. A yellow cursor will flash on the selected number and a keypad will be displayed to enter the value in millimeters desired.
3. After entering value, press the ENT button.
4. After pressing the ENT button, the system will automatically save the value.
5. Press the EXIT button to return to the MAIN menu.

Low Label Detection

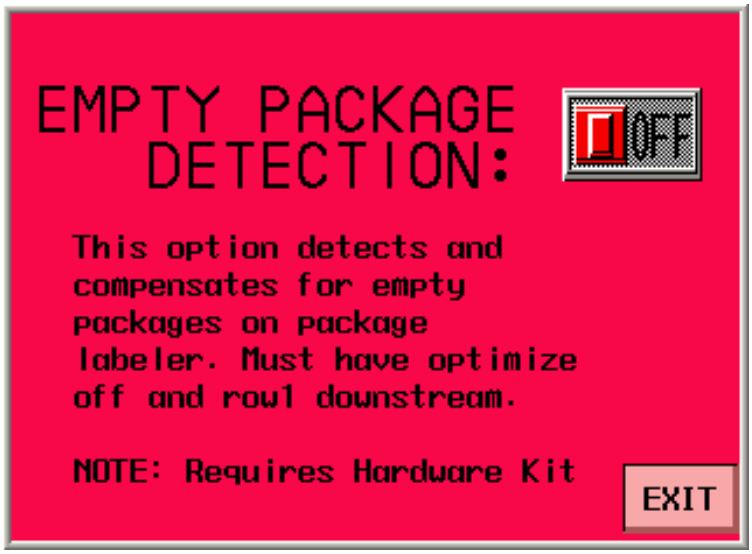
LOW LABEL DETECTION will detect a low label roll on the label reel. The labeler will detect a low label roll and display a warning on the touchscreen. At this time the labels can be spliced together to avoid re-threading of the label head and slowed production.

NOTE: This option requires a hardware (p/n 868586) and sensor kit (p/n 865068).

Empty Package Detection

EMPTY PACKAGE DETECTION will detect empty packages one row upstream of the labeler and will only place labels when product is present. This option is available for up to six (6) lanes. The labeler can be left in the ON state and it will automatically start and stop labeling when product is detected.

NOTE: This option requires a hardware (p/n 868586) and sensor kit (p/n 865068).



Passwords

This screen will allow the entry of new three-digit passwords.

The option for locking out the operator to edit parameters is set default to OFF. If it is turned ON, basic parameter editing will require the proper entry of either a LEVEL-1 or LEVEL-2 password, if EDIT screen protection is turned ON, the operator will only be able to load programs and start/stop the machine.

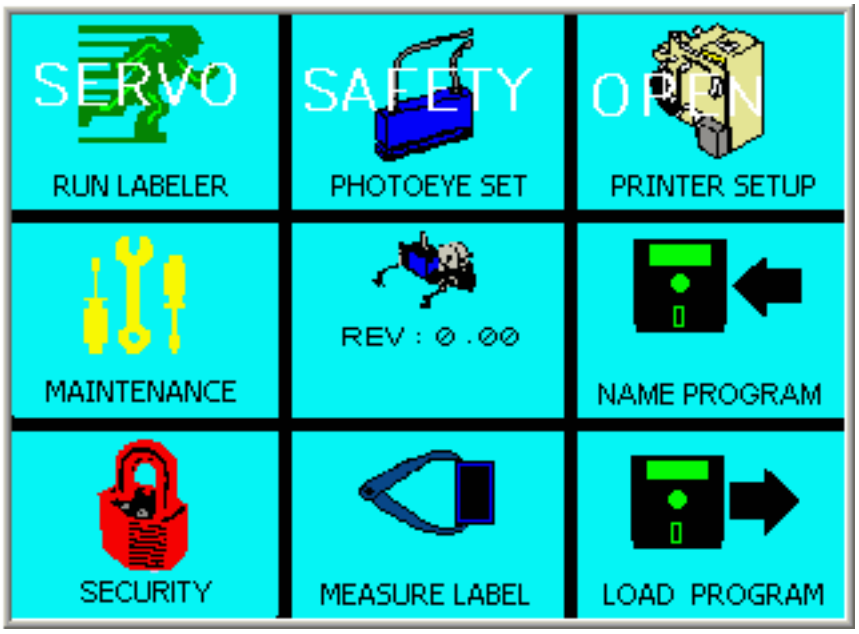
NOTE: If the passwords are forgotten, the maintenance screen can be re-entered by going into the Label sensor set screen and touching the upper left corner of the screen.

Servo Safety

This screen appears when the safety switch on the servo motor option has been tripped by lifting the servo motor safety guard or disconnecting the switch.

This safety feature was added to protect the operator from the movement of the labeler head due to the rapid movement and the potential ability for pinch point hazards. The machine will continue to be in motion after the servo safety guard has been lifted due to momentum carried by the labeler head. When the safety is reset, the labeler head will advance to the 'Home' position and the labeler will be ready for 'Run' mode.

⚠ WARNING *Moving parts. Pinch point hazard.*
Do not put hands into machine while running.



Maintenance Log

A maintenance log is a journal of all maintenance performed. Each entry includes a date, maintenance performed (details about the type of work done), and technician (who performed the maintenance). The maintenance log is also a place where a schedule is kept for further maintenance.

A maintenance log will clearly show daily inspections, tamp blade replacement, and so on. A master copy has been provided on page 4.35, please create a copy and store in the back of this owner's manual.

Service Log

A service log is a journal of all service work performed. Each entry includes a date, service provided (details about the type of service), and technician (who performed the service).

A service log will clearly show training provided, frequent wear items, and so on. A master copy has been provided on page 4.36, please create a copy and store in the back of this owner's manual.

Recommended Spare Parts

Qty.		Description
1 ea	846011	Linear Grease
1 ea	865007	Spring Set for Take-Up Unit
1 ea	866023	Spring Torsion, Right-Hand, for LH/DH Tension Roller
or	866024	Spring Torsion, Left-Hand, for RH/DH Tension Roller
2 ea	866048	Bearing for Dispense Roller
2 ea	866064	Bearing for Dispense Roller
2 ea	490407	Fuse, 5A
2 ea	866065	Unwind Brake Strip
1 ea	868135	Relay, 24 Volt, 12 Amp
1 ea	866121	Spring for Dancing Arm
1 ea	866127	Spring Torsion, Right-Hand
or	866128	Spring Torsion, Left-Hand
1 ea	890529	Fan, 24VDC, 26A, 172mm, 281 c.f.m.
1 ea	866519	Relay for Output
1 ea	890008	Timing Belt for Take-Up Unit
1 ea	866561	Belt for DH Motor, HTD-5, 320x15
1 ea	866562	Belt for Gearbox, HTD-5, 330x15
1 ea	880076	Timing Belt, Transporter, V2, 41T
2 ea	866801	Retaining Ring, 12mm External
2 ea	866802	Retaining Ring, 15mm External
1 ea	869514	Drive for Stepper Motors - Programmed
1 ea	866582	Single Valve Assembly
1 ea	866070	Drag Level Arm
1 ea	868694	Drag Level Arm Pad
1 ea	866134	Bearing One-way for Take-Up Unit
1 ea	866015	Bearing for Gearbox Main Shaft
1 ea	866440	Bushing for Take-Up Clutch Assembly
1 ea	866016	Bearing for Rubber Roller Outer
1 ea	866125	Take-Up Clutch Disc
1 ea	866438	Bushing for Take-Up Clutch Assembly
1 ea	866624	Gear for Clutch, #2, 30T
1 ea	866022	Bearing for Tension Roller
2 ea	860546	Fuse, MDA4A for Seal, 220 Volt

DATE CODE PRINTER

Printer Safety

- Read these instructions carefully. Follow all warnings and instructions marked on the printer.
- Always disconnect the printhead cables from the labeler control box and from the labeler chassis before cleaning or servicing the printer.
- Never operate the printhead unless it is installed in the mounting frame supplied. Maintain a maximum of 4mm gap between the printer and the print base.
- Never insert objects into the printer through any openings or gaps as they may touch dangerous voltage points or short circuit parts that could result in fire or electrical shock.
- Ensure the printhead connections cable is fully secured on both ends. Poor connection results in the printhead not being earth grounded properly.
- Use the cable supplied with the printer. The construction is a flex-type cable to accommodate the labeler movement. Be sure that the cables are not walked on or are not rubbing against anything during labeler motion.
- Do not attempt to service this product. Opening or removing guards may expose dangerous voltage, burns, and other risks. Refer all servicing to qualified personnel.
- Do not operate this printer in areas where explosive gases or substances are present.
- Under normal working conditions the printer is very hot. Take precaution when removing the type holder as it can easily burn you. The yellow warning sign on the type holder access door indicates a danger. Grip the door at the side to open. Only hold the type holder by its plastic handle. Place the type holder on a metal or non-combustible surface to cool. Never touch the metal type holder parts unless they have been out of the printer for a minimum of 20 minutes.

⚠ CAUTION *Hot surfaces. Do not touch.*
To avoid possible skin burns, disconnect and lockout power. Allow surfaces to cool before servicing or cleaning.

Disconnect the printhead from electrical and air supplies and refer servicing to qualified personnel under the following conditions:

- If the power cable is damaged or frayed.
- If the printer does not operate normally when the operating instructions are followed.

Adjust only those controls covered by these instructions. Improper adjustment may result in damage.

Printer Threading and Adjustment

Magazine Removal

To remove the foil magazine: Slide the catch away from the type holder access door and hold in place. Using the two handles withdraw the magazine. If the labeler is cycled while the cassette is off; the labeler will fault with a PRINTER ERROR and the yellow light will come on. Press F1 to clear the fault.

Foil Threading

1. Fit an empty foil core tube onto the rewind mandrel.
2. Disengage pinch drive from roller.
3. Remove label from new roll of foil.
4. Fit new roll of foil onto take-off mandrel (note the unwind direction as shown on threading diagram).
5. Thread foil around all rollers as shown on the threading diagram. **Note:** The gloss side of the foil should face inward throughout the foil path.
6. Attach foil end to empty core on rewind mandrel, gloss side facing inward.
7. Wind foil a few turns to track and tension it.
8. Engage pinch drive roller.

Re-Fitting Foil Magazine

Hold the magazine by the two handles, slide it on the locating pins and push to lock in place.

Fitting Type/Die Holder

NEVER ASSUME THAT A TYPE HOLDER IS COLD. Only pick up a type holder by its handle. Ensure the face of the magnetic catch is clean, open the red type holder access door, align the type holder within the two side locators and slide in until the magnet catches on the end plate. Close the door.

⚠ CAUTION *Hot surfaces. Do not touch.*
To avoid possible skin burns, disconnect and lockout power. Allow surfaces to cool before servicing or cleaning.

Foil Feed Adjusting Screw

This knob adjusts the amount of foil used per print. It is located toward the rear of the printer body adjacent to the air tubing entry points. Turning the knob in reduces the foil index distance. Turning the knob out increases the foil index distance. Be sure to fully tighten the locking nut after adjustment.

Printer Threading and Adjustment

Print Orientation

To rotate the print 90°: Loosen the printhead handle until it can be rotated. Orient the printhead as needed and retighten printhead handle.

Printhead Temperature Adjustment

The temperature control is located inside the labeler control cabinet. The control is set to 160°C at the factory. **To adjust the temperature:** The labeler control cabinet door must be opened. The temperature control is located on the right side of cabinet and can be adjusted by turning the circular knob on the face of the control.

Air Flow Controls

The air flow control is on the valve body mounted on the printer frame. It regulates the speed at which the printhead travels up and down. **Note:** It is very important that the print ram extends completely during each print cycle and that the ram fully returns before the next print cycle begins. Turning the adjustment screws in will slow down the ram speed. For higher speed operation, the flow controls for both the forward and return strokes must be increased. The pressure regulator on the labeler, which controls the printer valve pressure, should be set to 90 p.s.i. (6 Bar).

Printhead Leveling

The printhead height over the substrate is adjusted using the four 10mm vertical threaded shafts on the printer bracket top corners. **Adjusting the printer height:** First, adjust the height so that the printer does not contact the substrate during cycling. Then adjust each corner of the bracket downward until the printer begins to print on the label surface. Slowly adjust the printer downward until print quality is achieved. If the print is leaving an impression into the label backing paper, the printhead is adjusted too low. If the print is dark on one side and light on the other, then the printhead must be adjusted downward on the side that is light.

Printer Setup Touchscreen

The printer setup screen allows for control of an optional ink stamp, hot stamp, or thermal transfer printer.

PRINTER ON/OFF :	Turns the printer ON or OFF
PRINTER FAULT ON/OFF :	Turns the printer fault input ON or OFF (if equipped)
HOT STAMP SET TEMPERATURE :	Set point for hot stamp temperature in degree Celsius (150°C)
HOT STAMP ACTUAL TEMPERATURE :	Temperature gauge for hot stamp printer in degree Celsius
PRINTER DWELL :	Time the print signal is held high after each label move (milliseconds). Default from factory: 80mS
PRINTER WAIT :	How long the labeler will wait for the print head to retract before moving the label (milliseconds). Default from factory: 20mS
HOT STAMP HEAT :	Turns hot stamp heater output indicator ON or OFF

Item No.		Description
1	890410	Printer Post Block, Lower
2	890413	Printer Horizontal Rack Shaft
3	810108	Bolt, M8x30 Hex Head
4	866775	Washer, 8mm Flat
5	890412	Printer Vertical Rack Post
6	866981	Hot Stamp Vertical Screw
7	866767	Nut, M10 Hex
8	866776	Washer, 10mm Flat
9	810112	Bolt, M10x40 Hex Head
10	890416	Main Printer Mount Block
11	890403	Tapped Insert for Drive Head
12	810107	Bolt, M8x20 Hex Head
13	890021	Axle, Drive Head Roller, 150mm
	890533	Axle, Drive Head Roller, 200mm
14	866801	Retaining Ring, External, 12mm
15	866048	Ball Bearing
16	890020	Hub for 2-in. Idler Roller
17	890019	Idler Roller, 1-7/8-in. OD
18	890729	O-Ring, Silicone
19	890452	Printer Mount Adaptor
20	890293	Scale Bar
21	890420	Printer Scale Mount
22	810103	Bolt, M5x20 Hex Head
23	866582	Valve Assembly, Single
24	890414	Printer Valve Bracket
25	866827	Screw, M4x25 Socket Head
26	890402	Printer Mount Plate
27	890013	Unwind Mount Plate
28	890003	Tapped Insert
29	890017	Shaft Extension
30	866566	Fitting, Flow Control, 1/8 x 6
31	866253	T-Fitting, 8mm
32	866247	Silencer, 1/8
33	890434	Cam Lock, Chassis Tube
34	810105	Bolt, M6x25 Hex Head

Printer Bracket Assembly

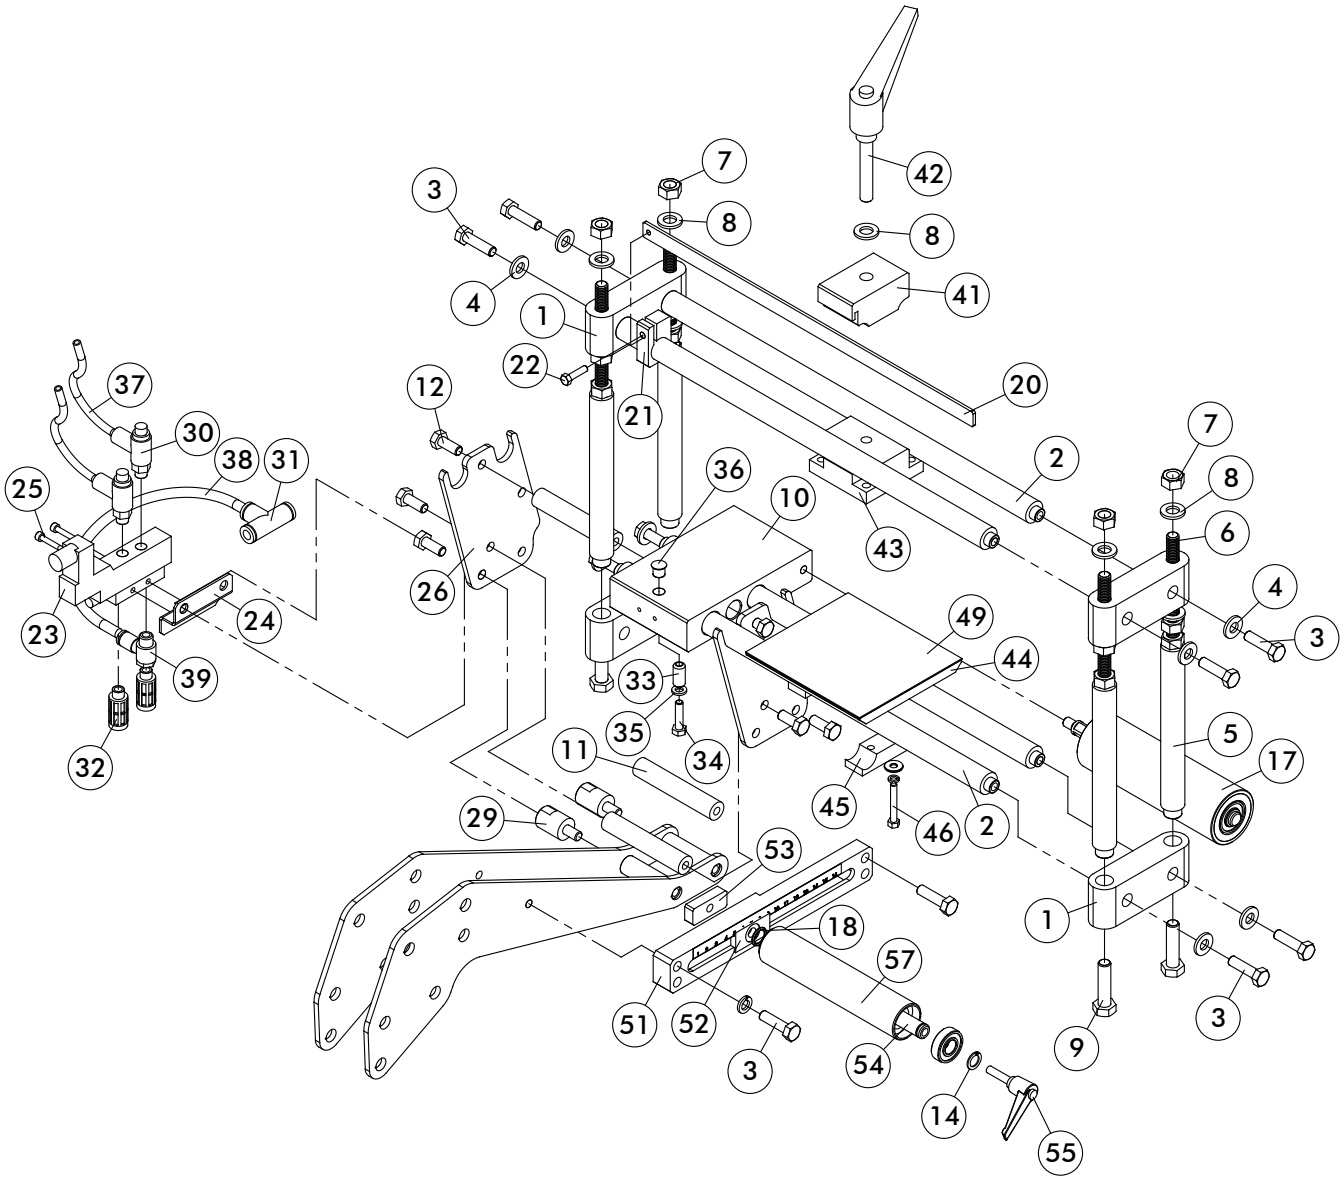
Printer Bracket Assembly (continued)

Parts List

Item No.		Description
35	866784	Washer, 6mm Split
36	E103	Plug, 3/8
37	866575	Tubing, 6 Pun
38	866576	Tubing, 8 Pun
39	866251	Fitting, 90°, 1/8x6
40	860665	Printer Mount Adaptor
41	890913	Printer Mount Cap
42	866601	Handle
43	890417	Printer Mount Adaptor
44	890874	HS Contact Pad Plate
45	890876	HS Platten Support
46	860296	Bolt, M5x35 Hex Head
47	866791	Washer, 5mm Large OD
48	860260	Washer, 5mm Split
49	890875	HS Contact Pad
50	860290	Washer, 8mm Lock
51	890948	Printer Adjustment Bar
52	890929	Roller Lock, Front
53	890930	Roller Lock, Back
54	890954	Shaft, Printer Adjustment
55	810057	Handle
56	890432	Scale Rule
57	890080	Roller, Small OD, 150mm Long
	890686	Roller, Small OD, 200mm Long

Printer Bracket Assembly (continued)

Diagram

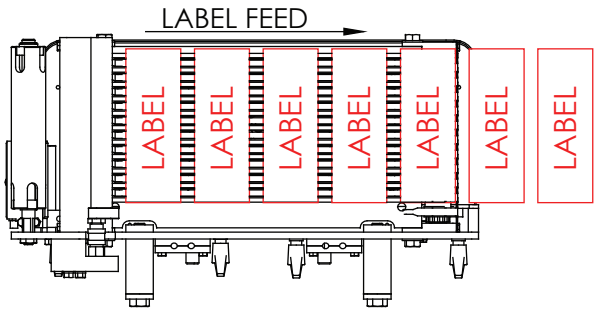


Troubleshooting

Problem	Indicators	Remedy
Printer does not cycle and LED on printer valve DIN connector is "OFF" and 24VDC relay LED is dim or "OFF"	Printer is turned off	Turn printer on
	Relay has failed or is not connected	Check relay connections first then replace relay
	Loose connection on relay input to stepper drive #1	Check connections
Printer does not cycle and LED on printer valve DIN connector is "OFF" and 24VDC relay LED is "ON"	Loose connection between relay output and printer valve connector	Check connections
Printer does not cycle and LED on printer valve DIN connector is "ON"	Line pressure is low	Restore system pressure
	Valve or valve coil has failed	Replace valve
Printer fault indicator comes "ON"	Ribbon is empty	Replace ribbon
	End of foil photoeye has failed	Replace photoeye
	Cassette is loose or type holder door is open	Replace cassette and close type holder door
	Switches on the cassette and type holder door have failed	Replace failed switches
Print quality is poor	Insufficient foil pull or air pressure	Restore line pressure and flow
	Printer not level with base	Readjust printer frame
	Temperature too high or low	Adjust temperature by using controller inside the labeler control cabinet
	Dirty, worn, or damaged dies or type	Replace type
	Damaged or out of position print base rubber	Adjust bottom base rubber block to a new position
	Printing foil not compatible with substrate	Contact foil manufacturer
	Label moving before printhead is clear	Increase print wait time
	Print dwell is too low	Increase print dwell time

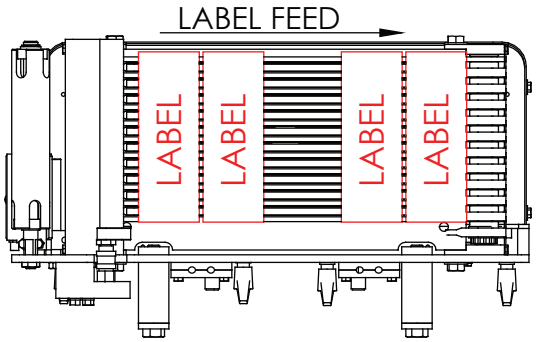
TROUBLESHOOTING

Sensing and Dispense

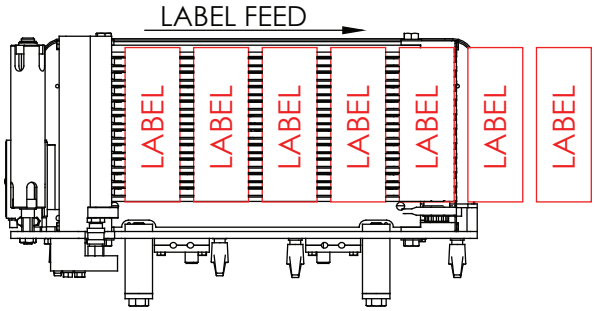


Problem	Indications	Remedy
Labels run out quickly without stopping	Labels misthread	Confirm labels are running in forked gap of sensor and not threaded around blow-on tube
	Label sensor not set for current material	Adjust sensor sensitivity per instructions
	Label sensor bad	After setting sensitivity, confirm RED LED is ON in the label gap and OFF over label stock
	Label speed too high	Lower label speed (or have maintenance increase acceleration rate in Maintenance screen)
	Label peel over parameter (#3) is set too low	Increase peel parameter

Sensing and Dispense

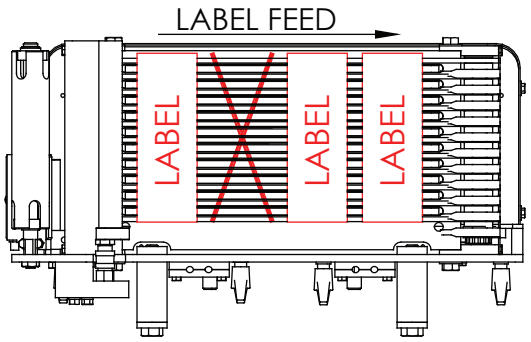


Problem	Indications	Remedy
Labels dispense two at a time, consistently in pairs	Label peel over parameter (#3) is set too high	Lower peel parameter and/or move sensor position as needed. This parameter should always be less than the label length



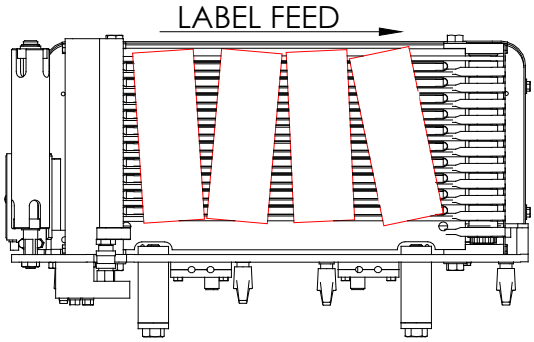
Problem	Indications	Remedy
Labels dispense two at a time, occasionally	Label sensor sensitivity not set	Adjust sensor sensitivity per instructions, page 3.16

Sensing and Dispense



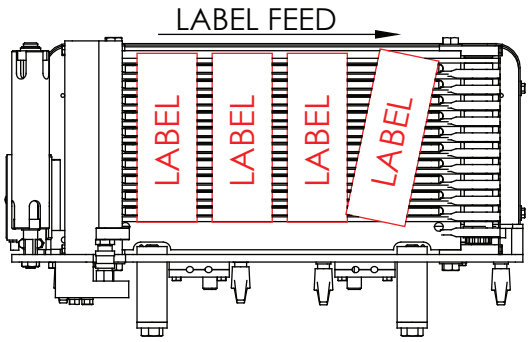
Problem	Indications	Remedy
Labels missing	Empty package detection sensor not set or adjusted	Check sensor height and adjust sensor (screw terminal) as needed to confirm sensor operation over product
	Label sticking to blow-on tube	Adjust blow tube direction and/or flow control and/or peel over parameter #3; blow on tube should be adjusted at 12 o'clock and set to peel edge
		Check for missing labels on label rolls
		Make sure knurled tension roller is locked down. See page 3.1
Label backing paper tearing		Make sure label reel is tightened against label roll to assure proper dancer operation
	Check peel bar edge for nicks or cuts	Replace peel bar if necessary
	Check label backing paper for heavy die cut marks	Replace label roll if cut marks are easily visible
		Make sure knurled tension roller is locked down. See page 3.1
		Make sure label brake arms are in position. See page 3.1

Transport Across Web

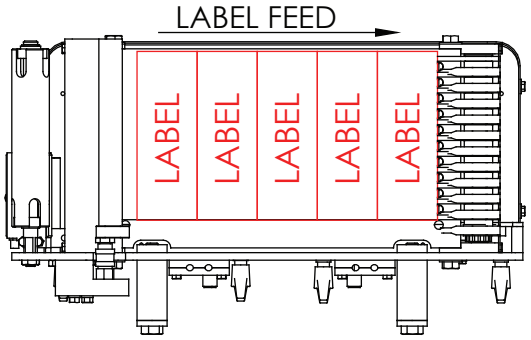


Problem	Indications	Remedy
All labels misaligned after transport, before tamping	Vacuum fans blocked or failed	Check for clear operation of all fans
	Blow-on tube directed out toward transporter and/or adjusted too high	Rotate blow-on tube where hole faces directly down toward transports or slightly back toward peel bar
		Adjust flow on blow-on valve on the end of the labeler by the air prep unit
	Peel over setting	Make sure at least 1mm of label edge is visible on peel bar, and not more than 3mm
	Label material stuck to tamp blades or transport belts	Clean and remove any material
	Labeler brake adjusted loosely	Increase brake tension on labeler
	Label material die cut into backing paper	Check liner for cut marks. If present, talk to label supplier about correcting; use 4mil or thicker labels to improve operation. Less than 4mil increases risk of die cut alignment problems
	Green transport belts loose	Tighten belts using adjustment bolts
		If labels are round or non-rectangular, be sure labels and photo sensor are positioned consistently and reading the same position on the label

Transport Across Web

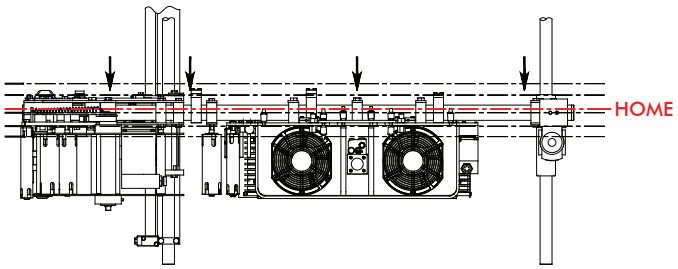


Problem	Indications	Remedy
First label out misaligned after transport, before tamping	Tamp retract time too short, resulting in first label dispensed making contact with the retracting tamp blades	Increase tamp wait time (parameter #7)
		Speed up tamp cylinder retract by opening flow control knob
		Parameter #7, tamp wait time, should always be set at least 20 mS higher than parameter #6, tamp time

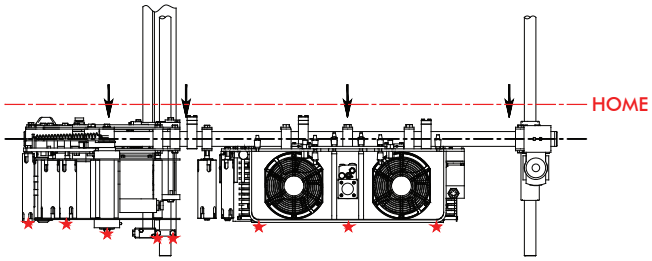


Problem	Indications	Remedy
Labels aligned but coming up short in position	Transporter stalling or belts slipping	Decrease transporter motor speed
		Tighten transporter belts

Placement in Machine Direction

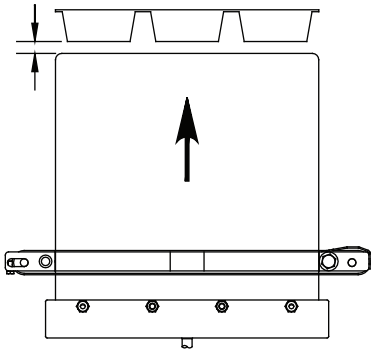


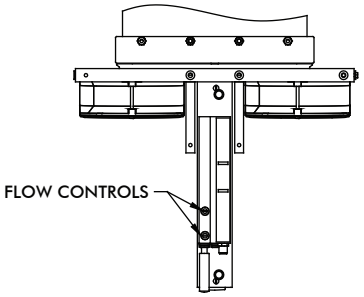
Problem	Indications	Remedy
Labeler stopping position varies	Longitudinal speed set too high	Reduce parameter #10
	Home position sensor defective	Replace sensor
	Home sensor slug adjusted too low	Raise sensor target panhead bolt height
	Label reels and/or guide collars have been moved	Reset inside reel and/or guide collar position



Problem	Indications	Remedy
Labeler runs past the home sensor	Longitudinal speed set too high	Reduce parameter #10
	Offset parameter #13 set too low	Move home position mount to allow parameter to be increased, minimum setting 20mm
	Home position sensor defective	Replace sensor
Labeler hits End of Travel Sensor	EOT (End of Travel) sensor slugs are adjusted too close to labeler operating region	Move sensor target panhead bolt minimum 2-in. outside of operating region
Labeler shifting motor stalls	Longitudinal speed set too high	Reduce parameter #10
		Decrease longitudinal acceleration rate in Maintenance screen
	Stepper motor defective	Replace stepper motor

Tamp

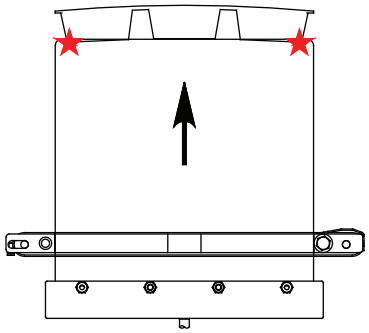




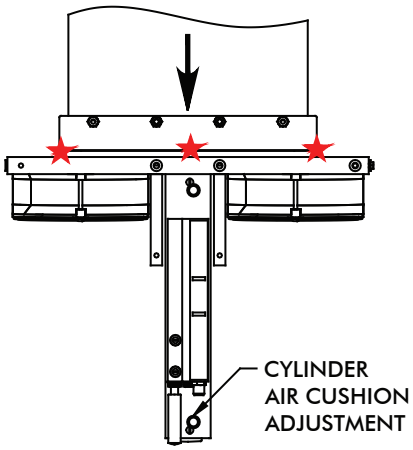
Problem	Indications	Remedy
Label Tamp not reaching surface	Not enough air pressure	Check regulator to confirm pressure is at 90 p.s.i. (6 Bar)
	Tamp time is not set high enough (parameter #6)	Increase tamp time
	Tamp cylinder flow control is not adjusted	Open flow control adjustment as shown
	Cylinder worn or shaft bent	Replace or repair cylinder

Note: For higher speed applications, the flow control adjustment should be left completely open and the tamp setting should be adjusted primarily using tamp time.

Tamp



Problem	Indications	Remedy
Label tamp not reaching surface	Too much air pressure	Check regulator to confirm pressure is at 90 p.s.i. (6 Bar)
	Tamp time is set too high for flow control adjustment	Decrease tamp time by 5mS increments or close off flow control adjustments one half turn until desired tamp is reached
Label tamp varying throughout the day	Supply air pressure varying and/or not high enough pressure source	Change or improve the air source to provide a minimum of 90 p.s.i. (6 Bar) to the labeler regulator
	Water in the tamp valve or regulator	Open drain on regulator and clear the water present
	Tamp valve or cylinder worn	Replace components



Problem	Indications	Remedy
Label tamp banging on return stroke	Cylinder air cushion is out of adjustment	Tighten air cushion until desired return stroke is achieved. Do not tighten cushion too much, or tamp blades will retract too slowly and impede the label dispense

Labeler Speed

Labeler speed and acceleration is a function of motor speeds, die configuration, and tamp times. The labeler speed is entered in mm/sec and the acceleration rate is entered in mm/sec^2. There are three motor options available; standard-torque, high-torque, and super-torque. The motor speeds listed below are average speeds for these motors. Some factors, such as temperature and label size, may reduce the actual speed that the labeler can achieve. In general, the labeler speeds should be set as low as possible while still maintaining packaging machine line speed.

Standard-Torque (Black)		
Motor	**Parameter**	**Max.**
Label Speed	8	400
Transporter Speed	9	600
Longitudinal Speed	10	400
Label Acceleration Rate	Maintenance	15000
Shift Acceleration Rate	Maintenance	2000

High-Torque (Burgundy)		
Motor	**Parameter**	**Max.**
Label Speed	8	500
Transporter Speed	9	700
Longitudinal Speed	10	500
Label Acceleration Rate	Maintenance	20000
Shift Acceleration Rate	Maintenance	3000

Super-Torque (White)		
Motor	**Parameter**	**Max.**
Label Speed	8	600
Transporter Speed	9	700
Longitudinal Speed	10	600
Label Acceleration Rate	Maintenance	25000
Shift Acceleration Rate	Maintenance	4000

Blow-On and Display

Location	Problem	Indications	Remedy
Blow-On	Blow-on does not activate with valve and relay LED (on PWB) indicators "ON"	Loss of air pressure	Restore line pressure
		Pressure regulator not set or faulty	Set or repair pressure regulator to 90 p.s.i. (6 Bar)
		Flow control out of adjustment	Open flow controls to obtain proper operation
		Valve coil damaged	Replace coil
		Valve(s) damaged	Replace valves
		FILM/PACK switch on PWB set to FILM	Set switch to PACK
	Blow-on does not activate with valve LED indicator OFF and relay LED (on PWB) indicators "ON"	Relay damaged or not seated properly	Replace or reinstall relay
		Connection between relay output and valve faulty	Check connections
		5 amp fuse on PWB board blown	Replace fuse and check isolation
	Blow-on does not activate relay LED indicators (on PWB) "OFF"	Drive I/O not reaching relay input	Check connections, reseat/replace PWB ribbon cables
		Drive I/O damaged	Replace drive
Display	Labeler does not display anything on screen	220 VAC disconnected	Check 220 VAC input
		Main control power fuse blown	Replace fuse
		24 VDC power supply fuse blown	
		24 VDC power supply failed	Replace power supply
		24 VDC power supply connection loose	Check connections on power supply pins and PWB
		24 VDC time delay relay failed	Replace time delay relay
		Touchscreen failed	Replace touchscreen

Common Fault

Location	Problem	Indications	Remedy
Common Fault	Labeler displays: "Communications Error Drive #1, 2, 3"		
	With both stepper drives and 75 VDC power supply GREEN LEDs "ON"	Drive DIP Switches not set properly	See page 5.1 for proper switch settings on drive # displayed on screen
		RS232 cable between drives and computer is disconnected	Check cables, reseat RS232 cable connectors/ verify cable pin-out to schematic on page 5.2, replace cable
		Bad communication ports on drive or touchscreen	Replace Drive # shown on screen. If Drive #1 is displayed, touchscreen port may also be bad.
			Check output of the power supply. Voltage 55VDC minimum, 62VDC average, 75VDC maximum. Replace power supply.
	With stepper drives and 75VDC power supply GREEN LEDs "OFF" and Touchscreen "ON"	75VDC power supply failed	Cycle power to reset. Check 2A fuse on Power Supply. Individually disconnect power cables to drives to eliminate shorted drive. Replace power supply.
	With stepper drive GREEN LEDs "OFF" and power supply GREEN LED "ON"	Power supply has experienced a high voltage fault	Check for over-voltage condition. Replace drive if 75VDC power is confirmed. Install isolation transformer, if AC peaks above 264VDC
	With drive RED LED "ON"	Stepper drive has faulted	Cycle power to clear fault/replace drive

Drives, Faults, and Sensors

Location	Problem	Indications	Remedy
Drive Power	Drive power GREEN LED is not "ON"	The drive is not receiving adequate DC voltage	Verify the VDC+ and VDC- connections. Voltage 55VDC minimum, 62VDC average, 75VDC maximum.
		Drive power cable screw terminals are loose	Tighten screws
Fault General	Labeler displays: "Stepper Motor has stalled or label feed has been disrupted" and YELLOW fault light is "ON"	A stepper motor has stalled	Clean any residual glue from peel bar and brakes. Lower speed and/or acceleration of motors.
		Labeler roll backing paper has torn	Rethread labeler and check brake and photo-eye for obstruction of backing paper
		Labeler NIP roller open	Close NIP roller
		Label roll is empty	Refill labeler
Fault End of Travel	Labeler displays "C.W. End of Travel Limit has been Hit" or "C.C.W. End of Travel Limit has been Hit"	The longitudinal shift has tripped on a clockwise (C.W.) or counterclockwise (C.C.W.) limit during a normal move cycle	Readjust the end of travel sensor positions or the move parameters or both. Also verify that no debris has built up on sensors.
Fault Drive	The drive fault RED LED is "ON"	The drive is overheating	Verify that drive heat sink does not exceed 55°C
		Drive is damaged	Replace the drive
Home/EOT Sensors	End of Travel and HOME proximity switches do not function with LEDs (RED) "OFF"	Proximity sensors do not have 24VDC or ground	Check connections
		Proximity sensors damaged	Replace proximity sensors
		Proximity sensor and contact distance too large	Check labeler mounting for planarity

Sensors, Labels, and Motor

Location	Problem	Indications	Remedy
Home/EOT sensors	End of Travel and HOME proximity switches do not function with LEDs (RED) "ON"	Proximity sensors damaged	Verify sensors signal operation voltage (+5V open/0.8V closed) at PWB
		Drive #3 inputs damaged	Swap Drives #2 and #3 in cabinet and re-test
Labels stopping	Label gaps missed or runaway labels	Label sensor out of adjustment	Set label sensor, see page 3.16
		Label speed set too high	Decrease label speed parameter or increase acceleration parameter (call Ultravac Services Inc.)
Motor torque	There is little or no holding torque; the power LED is "ON" and the motor fault RED LED is "OFF"	Current select AMPS DIP is set improperly	Confirm proper drive switch settings, page 5.1
		Motor internally shorted	Check motor impedance and replace if necessary
		Low AC line voltage	Verify incoming Line Voltage is minimum 208VAC and maximum of 264VAC
		Drive failure	Replace drive
Motor operation	Motor does not move with Drive Power LED (green) "ON"	Motor circuit or motor has short or open circuit	Disconnect power from the labeler and motor wiring from the drive (A+, A-, B+, B-). Check continuity across A phase and B phase (maximum of 1.0 ohms for large motor and 5.0 ohms for small motor). Check for isolation between phases and to ground.
	Motor jerking	Bad motor windings	Verify A and B loop as described above. Replace motor if necessary.

Power and Tamp

Location	Problem	Indications	Remedy
Power	Stepper drives power GREEN LEDs are "OFF" and the 75VDC power supply GREEN LED is "OFF"	No 220VAC power	Verify AC power, 208VAC minimum and 264VAC maximum
		Power supply has had a thermal shut down	Measure temperature at heat sink (60°C maximum)
		75VDC power supply damaged	Replace power supply
	Stepper drives power GREEN LEDs are "OFF" and the 75VDC power supply GREEN LED is "ON"	Short or open circuit in drive cabling or motor	Check drive cabling and then cycle AC power
		Power supply experienced an over voltage condition	Cycle AC power
	Touchscreen comes on, but 24VDC output does not	24VDC time delay relay failed	Replace time delay relay
Tamp	Tamp cylinder does not activate with valve and relay LED (on PWB) indicators "ON"	Loss of air pressure	Restore line pressure
		Pressure regulator not set or faulty	Set or repair pressure regulator to 90 p.s.i. (6 Bar)
		Flow controls out of adjustment	Open flow controls to obtain proper operation
		Valve coil damaged	Replace coil
		Valve(s) damaged	Replace valve(s)
		Tamp time set too low	Increase tamp time, see pages 3.15
	Tamp cylinder does not activate with valve LED indicator OFF and relay LED (on PWB) indicators "ON"	Relay damaged or not seated properly	Replace or reinstall relay
		Connection between relay output and valve faulty	Check connections
	Tamp cylinder does not activate. Relay LED indicators (on PWB) "OFF"	Drive I/O not reaching relay input	Check connections, reseat/replace PWB ribbon cables
		Drive I/O damaged	Replace drive

Date Code Printer

Problem	Indicators	Remedy
Printer does not cycle and LED on printer valve DIN connector is "OFF" and 24VDC relay LED is dim or "OFF"	Printer is turned off	Turn printer on
	Relay has failed or is not connected	Check relay connections first then replace relay
	Loose connection on relay input to stepper drive #1	Check connections
Printer does not cycle and LED on printer valve DIN connector is "OFF" and 24VDC relay LED is "ON"	Loose connection between relay output and printer valve connector	Check connections
Printer does not cycle and LED on printer valve DIN connector is "ON"	Line pressure is low	Restore system pressure
	Valve or valve coil has failed	Replace valve
Printer fault indicator comes "ON"	Ribbon is empty	Replace ribbon
	End of foil photoeye has failed	Replace photoeye
	Cassette is loose or type holder door is open	Replace cassette and close type holder door
	Switches on the cassette and type holder door have failed	Replace failed switches
Print quality is poor	Insufficient foil pull or air pressure	Restore line pressure and flow
	Printer not level with base	Readjust printer frame
	Temperature too high or low	Adjust temperature by using controller inside the labeler control cabinet
	Dirty, worn, or damaged dies or type	Replace type
	Damaged or out of position print base rubber	Adjust bottom base rubber block to a new position
	Printing foil not compatible with substrate	Contact foil manufacturer
	Label moving before printhead is clear	Increase print wait time
	Print dwell is too low	Increase print dwell time

PROGRAM PARAMETERS

Program Parameters

The program parameters is a journal of the program's individual settings for up to 21 individual product lines. Each program has unique parameters that can be documented in these charts.

A master copy has been provided on page 9.2, please create a copy and store in the back of this owner's manual.

Globaal Parameters

The global parameters is a journal of the parameters within the Matrix™ Crossweb Package Labeler.

A master copy has been provided on page 9.4, please create a copy and store in the back of this owner's manual.
