

Worm Composting

Harnessing Nature's Power for a Cleaner, Greener, and More Sustainable World

What is it?

Vermicomposting is an environmentally sustainable process that helps in waste management, improving soil quality and reducing soil erosion, improving drainage, controlling pests, increasing crop yields, and reducing greenhouse gas emissions. In addition, it is a highly efficient process and one of the fastest ways to produce finished compost using a relatively passive method.

Types of Worm Bins

Stackable Tray Worm Bins
Makes it easy to harvest worm castings and helps control moisture.

Do It Yourself Bin
You can make a bin with items that you have on hand such as a spare plastic bin.

Why Worm Composting?

- ✓ Reduces Greenhouse Gases
- ✓ Contributes to the reduction of food waste
- ✓ Speeds up production of compost
- ✓ Great for the garden!
