Strongyloide is a roundworm that causes the illness of '*Strongyloidiasis*'.

A 'silent killer' (*Strongyloide*) is infecting people in tropical & subtropical climates. Strongyloides are parasite that crawl in through skin & breed in the body indefinitely (*Auto-Infection*). This parasite makes people sick (*Strongyloidiasis*) & may kill.

INFECTION

Infection occurs when the Strongyloide parasite transfers from unhygienic grass or soil to humans or mammal pets. The parasite burrows through intact skin & crawls up into the heart & lungs, before being coughed up & swallowed into the gut, where it breeds indefinitely. The parasite breeds using 2 cycles, 1 leaving the body via faeces infecting other bodies. Second via auto-infection in the host body breeding until person dies.

Auto-infection means re-infecting. Small infective larvae penetrate the intestine-wall making their way back to the lungs then back to the gut & breeding, an endless cycle unless treated. Auto-infection has side-effects it frequently is accompanied by secondary infection by gut bacteria. As the infective larvae travels through the body, the gut bacteria often causes pneumonia, meningitis or septicemia.

Symptoms of Strongyloidiasis often mimic other diseases. Abdominal pain & diarrhea, itchy skin rashes, respiratory symptoms. The only symptom that is found only in Strongyloidiasis larva currents, a raised rash that moves randomly across the skin. Strongyloides are usually diagnosed by a blood test &/or fecal test. Locating juvenile larvae, either rhabditiform or filariform, in recent stool samples will confirm the presence of this parasite.

PREVENTION!

Prevention involves the individual practicing good hygiene & the community providing proper sanitation. Always wash face & hands when coming inside. Where there is the possibility of feces decomposing, scrub hands & make sure to wash between fingers. Individual's should not walk barefoot where there is the possibility of feces decomposing. If in doubt when you come inside scrub & wash feet especially between toes. Enforce pet feces removal. All this applies not only to people living in the tropical & subtropical climates.

But also to visitors & passers through.

! IMPORTANT !

Drink only filtered bottled water, every-time, all the time !

Wash hands & face before every meal !

Wash hands after every visit to toilet !

Do Not ! Kiss pet or any other animal !

Remove all pet/animal feces from home !

After walking barefoot outside, wash between toes !

TREATMENT !

Seek medical advise. Treatment of Strongyloidiasis can be difficult & Strongyloides has been known to live in individuals for upwards of 1–2 years after treatment. Continued treatment may be necessary if symptoms persist. Treatment should be continued until symptoms resolve themselves.

Special tablets need to be taken to get rid of worms completely. Even if one worm remains in the body, it can reproduce more worms. A 6 month follow-up is important to check that all worms have been completely killed otherwise more treatment will be required.

PS. Climate change is increasing the areas were these worms can thrive!

Remember good hygiene keeps you healthy!
