

SRT

Structural Resistance Tester

U.S. Patent #6158272

There is only one!

The only tool that tests for rot... not moisture.

Moisture detectors detect moisture.

The SRT detects damage.

Not all homes that have moisture behind the cladding have damage. The SRT eliminates the costly results of tearing off cladding to discover there is no water damage.

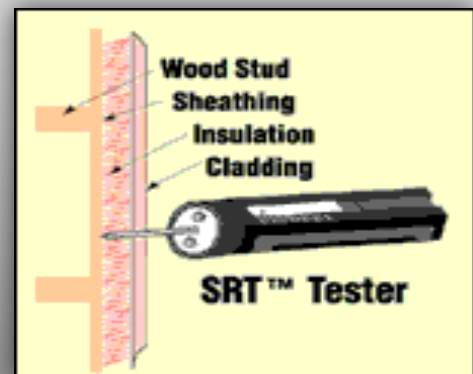

The SRT is calibrated to detect damage caused by rot. The stainless steel probe measures resistance of the substrate to determine if damage exists.

Great for testing:

Plywood • OSB • Gypsum Board
Dense Glass • Window Frames
Door Frames • Sills
Termite Damage

The SRT comes with the following:

- ◆ Hard Plastic Carrying Case
- ◆ CD Training Program
- ◆ SRT 30-40-45-50 Stainless Steel Probes
- ◆ 2 Slide Tabs with job data
- ◆ General Information and Instruction Sheets

Use the SRT for one month

You'll Love It...
