Your Choice for Home Inspection Services

Most home inspections are a "visual inspection", the inspector takes a look around, examines the condition of the home, tests the appliances and may make a determination of life expectancy.

But what if the beautiful newly painted home, is hiding secrets from the past under a fresh coat of paint! How will your reliable, well meaning and thorough inspector detect hidden moisture, air and rodent infiltration? The fact is he will not be able to make such determinations. The inspection agreement clearly states this is a non-invasive visual inspection, your home inspector is not responsible for what they couldn't see. In the end it could be your client saddled with a "sick" home, in need of costly repairs with no recourse for relief.

The pictures above show a room with radiant heat installed in the ceiling. Certified Building Inspections Enhanced Thermal Inspection verifies the system is operational.

Suggest to your client, a Thermal Imaging Inspection from the Professionals at Certified Building Inspections. We are members of the American Society of Home Inspectors (ASHI), and certified thermal imaging technicians. Certified Building Inspections comprehensive 180 point inspection program, and computer generated report, will provide all the information on the condition of the home your client will need in order to make a prudent decision.

Give us a call today to schedule your Enhanced Thermal Home Inspection.
