At USA Sleep Diagnostic Mobile Services LLC, our mission is to inform, educate and provide high quality care to people who are affected by sleep disorders. With many years of experience, we are committed to customer satisfaction.

USA Sleep Diagnostic Mobile Services LLC is a private owned company that provides a mobile diagnostic service for health care facilities. We take pride in doing our best to improve quality care for our patients.

Polysomnogram (PSG)

A polysomnogram (PSG) is a non-invasive and painless test to evaluate and monitor your sleep. It is designed to monitor your sleeping patterns and cycles from brainwaves, breathing patterns, snoring, heart activity and body movements throughout the night. The data is recorded and studied by our board certified sleep physician to accurately diagnose sleep disorders.

CPAP / BiPAP Therapy

Sleep apnea is a common sleep disorder that can be treated using a CPAP or BiPAP machine. A Continuous Positive Airway Pressure (CPAP) is a device to provide positive flow of air into the nasal passages so the patient's airway stays open during sleep. These devices come in a number of different types of facial masks. These masks are connected to a machine that can sit on a patient's night stand. A Bi-level Positive Airway Pressure (BiPAP) is a device to help patients get more air into their lungs.

MSLT

Multiple Sleep Latency Test (MSLT) is a diagnostic daytime test to diagnose narcolepsy. This test is also used to measure the degree of daytime sleepiness in a person. A MSLT is performed in the morning to ensure accurate results. This test has the patient take a number of naps during the testing period to measure brain waves, heart rate, muscle tone and eye movement.

Services We Provide
