Little Gasparilla Utilities 2023 Annual Drinking Water Quality Report PWS ID: 6080175

We're very pleased to provide you with this year's Annual Water Quality Report. We want to keep you informed about the water and services we have delivered to you over the past year. Our goal is and always has been, to provide to you quality and dependable supply of drinking water. This report shows our water quality results and what they mean. If you have any questions about this report or concerning your water utility, please contact Jack Boyer at 941-681-2778. You can obtain additional information from EPA at their safe drinking Water Hotline (800) 426-4791.

In 2015 we started purchasing water from Charlotte County Utilities, who purchases water from the Peace River Water Authority.

Source Water Assessment Plan: The Florida Department of Environmental Protection (FDEP) has performed a Source Water Assessment on CCU's system in 2023. These assessments were conducted to provide information about any potential sources of contamination in the vicinity of our wells. Potential sources of contamination were identified to include industrial waste water and domestic wastewater treatment plants with a low level of susceptibility. The assessment results are available on the FDEP Source Water Assessment and Protection Program website at http://www.charlottecountyfl.gov/departments/utilities/about-utilities/conservation/

Little Gasparilla Utility routinely monitors for contaminants in your drinking water according to Federal and State laws, rules, and regulations. Except where indicated otherwise, this report is based on the results of our monitoring for the period of January 1 to December 31 2023. Data obtained before January 1, 2024, and presented in this report are from the most recent testing done in accordance with the laws, rules, and regulations.

In the table below, you may find unfamiliar terms and abbreviations. To help you better understand these terms we've provided the following definitions: **Maximum Contaminant Level or MCL**: The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

Maximum Contaminant Level Goal or MCLG: The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

Action Level (AL): The concentration of a contaminant which, if exceeded, triggers treatment or other requirements that a water system must follow. Maximum residual disinfectant level or MRDL: The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

Maximum residual disinfectant level goal or MRDLG: The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

"ND" means not detected and indicates that the substance was not found by laboratory analysis.

Parts per billion (ppb) or Micrograms per liter (µg/l): one part by weight of analyte to 1 billion parts by weight of the water sample. **Parts per million (ppm) or Milligrams per liter (mg/l)**: one part by weight of analyte to 1 million parts by weight of the water sample. **Picocurie per liter (pCi/L)**: measure of the radioactivity in water.

Treatment Technique (TT): A required process intended to reduce the level of a contaminant in drinking water.

Radioactive Contaminants-Peace River Authority										
Contaminant and Unit of Measurement	Dates of sampling (mo./ yr.)	MCL Violatio n Y/N	Level Detected	Range of Results	MCLG	MCL	Likely Source of Contamination			
Alpha emitters (pCi/L)	1/23-12-23	N	6.8	1.2-6.8	0	15	Erosion of natural deposits			
Radium 226 + 228 or combined radium (pCi/L)	1/23-12/23	N	1.6	.2-1.6	0	5	Erosion of natural deposits			

Turbidity-Peace River Authority										
Contaminant and Unit of Measurement	Dates of sampling (mo/yr)	MCL Violati on Y/ N	The Highest Single Measurement	The Lowest Monthly Percentage of Samples Meeting Regulatory Limits	MCLG	MCL	Likely Source of Contamination			

Disinfectants and Disinfection By-Products -Little Gasparilla Utilities										
Stage 1 Disinfectants and Disinfec	tion By-Products									
Disinfec tant or Contaminant and Unit of Measurement	Dates of sampling (mo./	MCL or MRDL Violation Y/N	Level Detected	Range of Results	MCLG or MRDLG	MCL or MRDL	Likely Source of Contamination			
Chlorine (ppm)	Monthly 2023	N	1.5	.7 - 3.8	MRDLG = 4	MRDL = 40	Water additive used to control microbes			
Stage 2 Disinfectants and Disinfec	tion By-Products									
Contaminant and Unit of Measurement	Dates of sampling (mo/ yr)	MCL Violation (Y/N)	Level Detected	Range of Results	MCLG	MCL	Likely Source of Contamination			
Total Trihalomethanes (TTHM)	3/23, 6/23 9/23, 12/,23	N	51.85	34 -66.6	N/A	80	By-product of drinking water disinfection			
(ppb) Haloacetic Acids (HAA5) (ppb)	3/23, 6/23, 9/23, 12,23	Ν	33.15	25.5 -41.	8 N/A	60	By-product of drinking water disinfection

Hexach	nlorocyclo	7/23	Y/N N	.081	.081	50	50	Discharge from chemical factories

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. Little Gasparilla Utility is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing, your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline 1-800-426-4791 or at http://www.epa.gov/safewater/lead.

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity. Contaminants that may be present in source water include:

(A) Microbial contaminants, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.

(B) Inorganic contaminants, such as salts and metals, which can be naturally-occurring or result

from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas

production, mining, or farming.

pentadiene (ppb)

(C) Pesticides and herbicides, which may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses.

(D) Organic chemical contaminants, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas

stations, urban stormwater runoff, and septic systems.

(E) Radioactive contaminants, which can be naturally occurring or be the result of oil and gas production and mining activities.

In order to ensure that tap water is safe to drink, the EPA prescribes regulations, which limit the amount of certain contaminants in water provided by public water systems. The Food and Drug Administration (FDA) regulations establish limits for contaminants in bottled water, which must provide the same protection for public health.

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's Safe Drinking Water Hotline at 1-800-426-4791.

In our continuing efforts to maintain a safe and dependable water supply, it may be necessary to make improvements in your water system. The costs of these improvements may be reflected in the rate structure. Rate adjustments may be necessary in order to address these improvements. Thank you for allowing us to continue providing your family with clean, quality water this year. In order to maintain a safe and dependable water supply, we sometimes need to make improvements that will benefit all of our customers. These improvements are sometimes reflected as rate structure adjustments. Thank you for understanding.

Level 1 Assessment For Total Coliform

On 02-01-23 LGWU had a positive Total Coliform sample Violation. A repeat sample was not conducted within 24hrs as required at the same sample location. Additional samples were taken to clear the water sampling location along with a DEP assessment form. The assessment form was triggered due to sampling error on re-sampling the location within the 24hr time frame. The original failed sample was due to the sampling location being on a dead end line with no users due to Hurricane Ian. After flushing was conducted and additional samples were clear, we were able to close out the assessment.

(1) Total Coliform Bacteria: Coliforms are bacteria that are naturally present in the environment and are used as an indicator that other, potentially harmful, waterborne pathogens may be present or that a potential pathway exists through which contamination may enter the drinking water distribution system. We found Coliforms indicating the need to look for potential problems in water treatment or distribution. When this occurs, we are required to conduct assessment(s) to identify problems and to correct any problems that were found during these assessments.
