

Imagine Never Having to Shave Again

[by France DiPaola]

There is a **NEW LASER** in town that is **VIRTUALLY PAINLESS**, and can help you shed unwanted hair before swimsuit season. It's the SopranoXL. This new technology has revolutionized laser hair removal. Its advanced technology replaces unpleasant, time-consuming and temporary hair removal methods such as waxing, and sugaring. Older style lasers such as the Ruby, Alexandrite, IPL or YAG which date back to 1995 are painful and cannot do all skin types. Today, clinical studies prove that the diode laser can achieve the best results – FAST!

The SopranoXL, a revolutionary diode laser system is intended for hair removal and permanent hair reduction by 90% – 95%. This diode laser can penetrate deep into the dermis (810nm) where the hair follicle is located. During a laser hair removal treatment, light passes through the skin and is absorbed by the melanin in the hair shaft. This absorption raises the temperature of the hair follicle to 45°C and thermally destroys the cells responsible for re-growth. This innovative technology offers "pain-free, hair-free" laser hair removal treatments that work safely by gently delivering a repetitious low fluence pulses to slowly increase the temperature of the hair follicle. Once the required heat is achieved, the hair follicle cannot reproduce another hair. The laser in motion action eliminates skipped spots and ensures client comfort. There is no down time, enabling patients to resume their regular activities immediately after treatment.

It is the world's first laser hair removal system that does not require topical, cooling or other numbing agents prior to treatment.

No need to use bleaching creams as it can treat dark pigmented skin. Clinical results show that the SopranoXL is intended for use on all skin types (Fitzpatrick Skin Type I-VI) including tanned skin.

Like all hair removal methods, the best time to treat the hair is when it is in the growing phase (anagen). Therefore appointments should be scheduled every 4 – 8 weeks depending on the area being treated. Individual treatments vary however on average 6 – 8 sessions are needed for maximum clearing.

SopranoXL laser has been tried, tested and finally approved! I have tried other laser technologies that did not compare to the speed and comfort of the SopranoXL. The others were painful! I am continually seeking alternatives to agonizing hair removal methods. I like to encourage my clients to make the switch from waxing to laser and electrolysis for permanent hair removal. Clients who have tried the SopranoXL said their hair was almost nonexistent after one treatment and did not shave the area for many weeks in between their next treatment. Now we can offer a complete solution to unwanted hair by combining laser and electrolysis. ■

Visit confidentimagechezfrance.com and view a short video and see for yourself how the laser works. Don't stay with painful procedures using old technology. There is no need to grit your teeth and take it like a punishment. There is a virtually painless way to get rid of that embarrassing body hair. So take a second look and find out more about this amazing new technology that is available to you.

France has made the idea of helping others feel good, a mantra for her business. A 2010 nominee of Niagara Entrepreneur of the Year Awards, she aspires to make a difference in her specialized field of electrolysis, laser hair removal, vascular blemish and skin tag removal, microdermabrasion, anti-aging facials, natural skin care and teeth whitening.
