In metal fabricating or manufacturing we can be faced with welding or heat treat discoloration, rust or defective coatings. All of the above can cause the final finish of the product to fail. BCM can help by using an abrasive blasting process to remove rust, paint, weld discoloring & scale along with heat treating discoloring. When processed, the part is blasted with an abrasive media that acts like tiny chisels cleaning the surface along with the hard to reach areas. Once blasted, the parts surface has an anchor effect that's been proven to provide better adhesion for paints, powder coats, and other coatings. promoting a longer lasting finish for your products. For more information on our services give us a call or visit our web site at.
