

CONSTITUTIONAL MEMORY

The Universal Identity & Trust Layer for AI

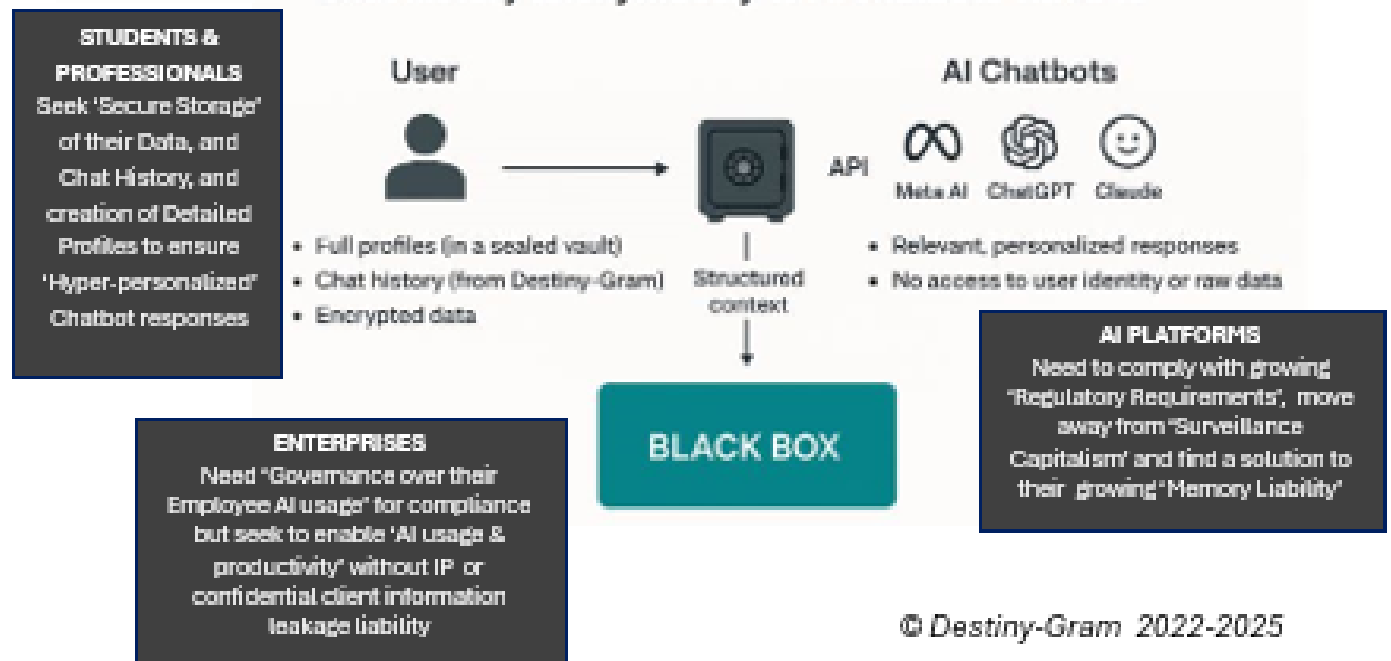

*"Transforming the £150 Billion AI Personalization Market
Through Four Distinct Privacy Architectures"*

Constitutional Memory is to be the 'Universal Identity and Trust layer for AI chatbots and Enterprises', offering a final solution to the 'Memory Liability' posed by AI companies and their Enterprise Clients holding users' personal data and information. AI companies currently 'Harvest Data' and use conversation history which lacks structured, comprehensive user understanding. 'Opting Out' of their data sharing/chat-history features only destroys the personalisation sought by users. Constitutional Memory creates user-controlled detailed encrypted structured personal profiles and context analysis of chat history across multiple AI-platforms for anonymised AI-chats and secure hyper-personalised responses using AI analysis and API Middleware.

💡 THE 'BLACK BOX' SOLUTION

Destiny-Gram's "black box" sends personal profiles and chat history anonymously to AI chatbots via APIs
