7. *The creation and sustainability of highly functioning care teams require essential competencies and skills in their members.*

In 2009, 6 associations formed the Interprofessional Education Collaborative with the goal of advancing interprofessional educational learning experiences to better prepare students for collaborative and team-based care. A panel of experts appointed by this collaborative in 2010 developed a set of core competencies in 4 domains to ensure that students had the foundation of knowledge, skills, and values they need to function as part of a team to provide effective patient-centered collaborative care: values and ethics, roles and responsibilities for collaborative practice, interprofessional communication, and teamwork and team-based care.

The panel further identified 38 competencies that describe essential behaviors across the 4 core domains. For example, under the interprofessional teamwork and team-based care domain, students should be prepared to "share accountability appropriately with other professions, patients and communities for outcomes relevant to prevention and health care. Another example, under the roles and responsibilities domain, they should be able to "explain the roles and responsibilities of other care providers and use the unique and complementary abilities of all team members to optimize patient care" (17). However, these skills and competencies are not incorporated into training programs for most health care professionals. This lack of training needs to be addressed, and currently functioning teams should have procedures in place to ensure the development of members' core competencies (18).
