BACKGROUND
Management of mental health disorders requires an interprofessional approach for the appropriate management of disease symptoms and adverse drug reactions. At the University of the Pacific and University of Missouri-Kansas City, faculty noted a need for more robust interprofessional education (IPE) focused on the management of complex psychiatric disorders and associated comorbidities.

Objectives:
- To develop a telehealth IPE designed to facilitate collaboration between nurse practitioner (NP) students and pharmacy students in order to optimize provision of mental health care.
- To build effective and sustainable relationships with partners across state borders, in order to improve interprofessional education.

METHODS

Study Population (n=234):
- 28 psychiatric mental health NP students
- 206 pharmacy students

Intervention:
- Students from the 2 disciplines were divided into teams of 1 NP and 1 or 2 pharmacy students.
- A total of 140 teams were created. Each NP student was a member of 5 teams and each PharmD student was only on 1 team.
- Cases were developed and housed in NEEHW Perfect®, which is an educational electronic health records (EHR) platform.
- One Pharmacy student was assigned as the team leader and responsible for contacting their team members.
- Two mandatory synchronous video-conferences were required for each team. Students could use any platform of their choice.

First Email Interaction:
- Team leader was responsible for making team introductions and for scheduling the two video-conferencing encounters.

First Video-Conference:
- Roles and responsibilities of each health professional
- Discussion of individual curricula
- Discussion of where each professional is likely to encounter a patient with a psychiatric condition
- Discussion of differential diagnosis and assessment of the assigned patient case

Second Video-Conference:
- SBAR (situation, background, assessment and recommendation) communication strategy employed by the pharmacy students to relay their recommendations to the NP.
- Followed by team discussion of the NP student's plan versus pharmacy students' plan

RESULTS

Student Attitudes Regarding the IPE

RESULTS FROM SPICE-R2 SURVEY (N= 181)

DISCUSSION

Strengths:
- Majority of students learned something new from their team member(s).
- Statistically significant movement in student attitudes on the SPICE-R2 survey was encouraging however from a discipline specific analysis, the lack of statistically significant movement by NP students was concerning. One explanation could be already positive perceptions even at the beginning of the IPE.
- Creative scheduling allowed faculty to manage vastly different numbers of students from each profession.
- Students from different states (Missouri and California) were able to collaborate through the use of videoconference technology.
- Student self-scheduling allowed for flexibility even with differing time zones and curricula.

Limitations:
- More objective data on the nature and quality of the interactions were not obtained.
- Objective, performance-based evaluations of the solution of the cases is the subject of future research.

METHODS

Evaluation Tools Used:
- Pre/post SPICE-R2 survey (validated)
- Student attitudes regarding the IPE
- Peer assessment of team members

Statistical Methods:
- Paired T-test was used to compare changes in student attitudes on the SPICE-R2 survey
- General descriptive statistics were used to determine student attitudes about the IPE and for the peer assessments
