

C516 GENERIC HEAT PUMP CONTROLLER - 24 VAC

FEATURES

The C516 Heat Pump controller is a 24 volt controller that controls the compressor contactor and has inputs for High Pressure, Low Pressure, Condensate Overflow and Low Temperature safety limits and cut outs.

BENIFITS

Older versions of Heat Pumps had many different configurations of electrical connections and components to control and protect the Heat Pump. The simple design of the C516 connects to the compressor contactor and the existing Heat Pump safety lockouts quickly connect to control board with spade connectors; adding modern control in both heating and cooling modes to your old or new chassis.

UNIVERSAL LOCK-OUT RELAY BOARD

Versatile for many in-suite applications, and can be used to replace many obsolete CCM controllers used by ClimateMaster, McQuay, CGC and other manufactures.

WARRANTY

The C516- replacement control board is brand new, not rebuilt or refurbished and all boards include a 1 year unconditional parts warranty.
