WHAT IS SCRATCH AND WHAT IS THE BENEFIT?

Scratch grains are both a feeding method as well as a type of feed. The method involves scattering your chicken's feed on the ground, which encourages them to scratch at the ground with their feet to reveal the food.

If you are trying to keep tame chickens, scratch grains is a great option. Many people feed their chickens from bulk feeders which are impersonal and distant. By scattering the feed yourself, the chickens will run right up to you and learn to associate people with happiness.

Offering your chickens an activity while they eat gets them up and about. Not only do they get exercise, but is a good way to get them up so you can collect their eggs more easily. Foraging is healthy exercise for chickens and discourages lazy behavior.

When and How Much Scratch Grains Should I Feed My Chickens? Scratch grains are low in protein and high in calcium, both of which mean you cannot form a complete diet out of these grains alone. Scratch grains should not be used as a replacement for normal feed, but as a grain supplement. Too much grain means that the chickens will not have an appetite for normal food. Only about 10% of the chicken's diet should be composed of scratch grains. The best time to feed chickens is in the afternoon after they have finished eating a complete feed. They should be able to eat what you've put down within 20 minutes.

In short, scratch grains are a great way to supplement your chicken's diet and encourage health behavior, like scratching and socialization. Just make sure not to let it dominate your hen's diet.
